Keywords: *Solidification, Liquid-solid interfaces, Surface energy, Differential geometry, Asymptotic series, Vector analysis, Three dimensional, Anisotropy, *Phase field models, Allen-Cahn equation, Gibbs-Thomson equation, Xi vector.

In the paper the authors present a new formulation of a large class of phase-field models, which describe solidification of a pure material and allow for both surface energy and interface kinetic anisotropy, in terms of the Hoffman-Cahn xi-vector. The Hoffman-Cahn vi-vector has previously been used in the context of sharp interface models, where it provides an elegant tool for the representation and analysis of interfaces with anisotropic surface energy. The authors show that the usual gradient-energy formulations of ansotropic phase-field models are expressed in a natural way in terms of the vi-vector when approximately interpreted. The authors use this new formulation of the phase-field equations to provide a concise derivation of the Gibbs-Thomson-Herring equation in the sharp-interface limit in three dimensions.

Defective Structures of Barium Yttrium Copper Oxide (Ba2YCu3Ox) and Ba2YCu3-yMyOz (M=Fe, Co, Al, Ga, ..).
Final rept.
A. Santoro. 1992, 44p.
Pub. in Chem. Supercond. Mater., p146-189 1992.

Keywords: *YBCO superconductors, *Crystal defects, High temperature superconductors, Vacancies(Crystal defects), Twinning, Substitutes, Reprints, *Yttrium barium cuprates, Oxygen transport.

The structural determination of Ba2YCu3O(x) for 6.8 = or < x = or < 7.0 was completed in several laboratories by Rietveld analysis of powder neutron diffraction data. The neutron diffraction experiments confirmed the space group Pmmm and the main structural features found by x-rays by Siegrest et al., but revealed that some of the oxygen assignments made in the x-ray studies were not entirely correct. The refined structural parameters obtained in four of these neutron diffraction analyses are given and the structure of Ba2YCu3O7.0 is schematically illustrated where it is compared with the parent structure of perovskite. Data collected at low temperatures revealed that no phase transitions take place in going from room temperature down to 5K.

Neutron Powder Diffraction Study of the Structures of La1.9Ca1.1Cu2O6 and La1.9Sr1.1Cu2O6+Delta.
Final rept.
A. Santoro, F. Beech, and R. J. Cava. 1990, 6p.
Pub. in Materials Research Society Symposia Proceedings 166, p187-192 1990.

Keywords: *Crystal structure, Tetragonal lattices, Lattice parameters, Neutron diffraction, Superconductors, Reprints, *Lanthanum calcium cuprates, *Lanthanum strontium cuprates, Reitveld method, Powder diffraction.

The title compounds are structurally isomorphous and crystallize with the symmetry of space group I4/mmm. The lattice parameters are a = 3.8248(1), c = 19.4286(5)A for La(1.9)Ca(1.1)Cu2O6 and a = 3.8601(1), c = 19.9994(5)A for La(1.9)Sr(1.1)Cu2O(6 + delta). The structure can be easily derived from that of La2CuO4 by substituting the layers of composition CuO2 present in La2CuO4 with a block of three layers having composition and sequence (CuO2) - (R) - (CuO2), where R is Ca, Sr, and/or La. Although the general structural configuration is the same for the Ca and the Sr compounds, the distribution of the metal atoms is different in the two cases.

Normal Modes and Structure Factor for a Canted Spin System: The Generalized Villain Model.
Final rept.
W. M. Saslow, and R. W. Erwin. 1992, 10p.
Pub. in Physical Review B 45, n9 p4759-4768, 1 Mar 92.

Keywords: Structure factors, Heisenberg model, Antiferromagnetism, Ferromagnetism, Spin waves, Hamiltonians, Reprints, *Villain model, Normal modes.

The generalized Villain model has a rich variety of possible structures, ranging from a pure ferromagnet to a pure antiferromagnet. In between these extremes, the system is canted. Using a Heisenberg exchange Hamiltonian and linearized spin-wave theory, we have studied the normal modes and structure factors for this model. The exchange ratio J'/J and the external field have both been varied. The effect of canted spin structures on the modes and structure factors is readily seen. We believe that it is now a practical matter to study the normal modes and structure factors for more complicated systems described by this type of model.

Study of the Hydroxycarbonate Precursor Route to the YBa2Cu3O7-x High Tc Superconductor.
Final rept.
J. J. Ritter, and J. F. Kelly. 1989, 8p.
Pub. in Proceedings of Symposium on High Temperature Superconducting Compounds: Processing and Related Properties, Las Vegas, NV., February 27-28, 1989, p303-310.

Keywords: *YBCO superconductors, *Precipitation(Chemistry), *Precursors, High temperature superconductors, Chemical composition, Synthesis(Chemistry), Particle size, Polycrystalline, Reprints, *Yttrium barium cuprates, Hydroxycarbonates.

The precipitation of the mixed hydroxycarbonates of Ba, Y and Cu as precursors to the YBa2Cu3O(7-x) high T(c) superconductor is an attractive route to this material. However, studies in our laboratory indicate that powder homogeneity is strongly dependent upon ionic concentrations and system pH. Moreover, we have assessed the composition of the precipitated moieties. These data have been incorporated into controlling the precipitation process in order to optimize particle size and powder homogeneity. Further processing of these powders has yielded polycrystalline solids with sharp transitions near 95K and high transport current densities.

Substitution-Induced Midgap States in the Mixed Oxides RxBa1-ChiTiO3-Delta, with R=Y, La, and Nd.
Final rept.
S. W. Robey, L. T. Hudson, C. Eylem, and B. Eichorn. 1993, 7p.
Pub. in Physical Review B 48, n1 p562-568, 1 Jul 93.

Keywords: *Electronic structure, *Band theory, Photoelectron spectroscopy, Ultraviolet spectroscopy, Barium titanates, Binding energy, Substitutes, Reprints, *Yttrium barium titanates, *Lanthanum barium titanates, *Neodymium barium titanates, Metal insulator transition, Mixed oxides.

Changes induced in the electronic structure of BaTiO3 by substitutions of R=Y, La, or Nd for Ba to form the mixed oxides, R(x)Ba(1-x)TiO(3-delta) have been investigated using ultraviolet photoelectron spectroscopy. Substitution of formally R(3+) ions for Ba(2+) leads to the introduction of filled states in the band gap that are shown by resonant-photoemission measurements to have significant Ti 3d character, consistent with a Mott-Hubbard-insulator description for these oxides. Various contributions to the binding energy and width of these states are considered. It is suggested that the dominant factor is electron-electron correlation and this leads to the estimates U approx equals Delta approx equals 3 eV for this system, where U is the correlation energy for the 3d electrons and Delta is the charge-transfer energy.

Sponsored by Department of Energy, Washington, DC.
Pub. in Physical Review B 47, n10 p6138-6141, 1 Mar 93.

Keywords: Orthorhombic lattices, Platinum intermetallics, Ternary compounds, Neel temperature, Neutron diffraction, Magnetic moments, Reprints, *Uranium platinum germanides, *Magnetic ordering, Uranium intermetallics, Germanium intermetallics, Powder diffraction.

The orthorhombic uranium (1:1:1) ternary compound UPtGe has been studied by means of neutron powder diffraction, using both the time-of-flight method at a spallation source and the constant-wavelength reactor method. The material exhibits incommensurate magnetic order with q = (0,0.5543,0), with a uranium moment at the lowest temperature of 1.11 mu(sub B) and a Neel temperature of 51 K. The moments are confined to the bc plane, which includes the propagation vector for the incommensurate modulation, and they rotate within that plane as one moves parallel to the b axis. The magnitude of the ordered uranium moment is the only order parameter in the problem.

Keywords: *Crystal structure, Antiferromagnetic materials, Gold intermetallics, Tin intermetallics, Neutron

diffraction, Magnetic properties, Reprints, *Uranium gold stannides, Uranium intermetallics, Powder diffraction, Uranium palladium stannides, Uranium copper stannides.

The uranium intermetallic compound UAuSn has been studied by means of neutron powder diffraction. It crystallizes in the CaIn2 structure type, with space group P6(3)/mmc, in agreement with previous x-ray work. Below 37 K, it exhibits long-range antiferromagnetic order, in a double-sized orthohexagonal magnetic unit cell. At the lowest temperature measured, the uranium moment is 1.10 mu(sub B). The magnetic structure is collinear with moments parallel to the orthorhombic b axis and the magnetic space group is C(p)m'cm'. We discuss the Au/Sn disorder in terms of metallic radii and discuss the consequences of this symmetry on the collinearity of the magnetic structure. These results are compared with work on the isostructural compounds UPdSn and UCuSn.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity 3, n1 p1590-1593 Mar 93.

Keywords: *YBCO superconductors, *Superconducting films, *Laser ablation, High temperature superconductors, Scanning tunneling microscopy, Temperature dependence, Transition temperature, Critical current, Substrates, Thin films, Reprints, *Yttrium barium cuprates, Lanthanum aluminates.

YBa2Cu3O(7-delta) films have been laser ablated under a variety of conditions, onto four different substrate materials. Using scanning tunneling microscopy, it was observed that the films grow by an island nucleation and growth mechanism. The properties of the films were studied as functions of the deposition conditions. Films on LaAlO3 had the best and most reproducible properties. The superconducting transition temperatures of films deposited on LaAlO3 proved to be fairly insensitive to the substrate temperature during deposition; T(c) > 90 K were obtained for films deposited over a temperature range from 760 to 850 C. The oxygen partial pressure during the deposition had a large effect on the transition temperature; the highest T(c)s were obtained for films deposited in 26.7 Pa (200 mTorr) oxygen.

Magnetic Ordering of the Cu Spins in PrBa2Cu3O6+x.
Final rept.
N. Rosov, J. W. Lynn, G. Cao, J. E. Crow, J. W. O'Reilly, and P. Pernambuco-Wise. 1992, 8p.
Pub. in Physica C 204, p171-178 1992.

Keywords: Neel temperature, Neutron diffraction, Single crystals, Antiferromagnetic materials, Copper, Reprints, *Praseodymium barium cuprates, *Magnetic ordering.

Neutron diffraction has been employed to investigate the magnetic ordering of the Cu spins in a single crystal of PrBa2Cu3O(6+x). At small x we have observed a Neel temperature T(N) of 370 K, where both the chain and plane Cu spins order simultaneously. For x approx 0.6, the Cu planes still order at T(N) about 370 K; however, the ordering temperature of the chain spins has decreased to about 160 K. The observed intensities of the magnetic reflections cannot be explained by keeping the chain layer Cu spin direction in the ab plane; rather, the chain moments must have a component along the c direction. We discuss these results in light of recent optical reflectivity measurements on PrBa2Cu3O(6+x) by Takenaka et al. (Phys. Rev. B 46 (1992) 5833).

Pub. in Physical Review B 47, n22 p15 256-15 265, 1 Jun 93.

Keywords: *Crystal structure, Neutron diffraction, Magnetic moments, Reprints, *Neodymium barium copper niobates, *Praseodymium barium copper niobates, *Magnetic ordering.

Using neutron diffraction, we have studied the crystal structure and magnetic ordering of the rare-earth and Cu moments in the layered perovskite systems NdBa2Cu2NbO8 (Nd 2:2:1:8) and PrBa2Cu2NbO8 (Pr 2:2:1:8). These are systems similar to R Ba2Cu3O(6+x) (R 1:2:3:(6+X)) for which the chain Cu-O layers have been fully replaced by layers of Nb-O octahedra. Powder profile refinements below 20 K show that both Nd 2:2:1:8 and Pr 2:2:1:8 are in space group I4/mcm, because the near-neighbor Nb-O octahedra are rotated about the c axis in opposite senses. The Cu moments are ordered below 375(10) K for Nd 2:2:1:8 and 340(15) K for Pr 2:2:1:8, with saturation moments in both cases of 0.5(1)mu(sub B). The near-neighbor Cu spins are aligned antiparallel, just as for the Cu 'plane' ordering in R 1:2:3:(6 + X).

Keywords: Orthorhombic lattices, Cryogenic temperature, Hydrogen bonds, Deuterium compounds, Iron compounds, Neutron scattering, Inelastic scattering, One dimensional, Hydrates, Reprints, *Ferrous trimethylammonium chloride, Ising ferromagnets.

Ferrous trimethylammonium chloride (FeTAC) is a member of a family of compounds that consist of chains of bihalide-bridged metal ions aligned along the b axis of the orthorhombic unit cell. FeTAC orders three dimensionally below T(N) = 3.16 K, with the moments, which are canted from the b axis by approx 20 deg, coupled ferromagnetically along the b axis and staggered along the (left bracket) 101 (right bracket) direction. The order parameter follows the exact Onsager solution for a rectangular 2D Ising lattice below T/T(N) approx 0.95. However, quasielastic scattering measurements in the vicinity of T(N) show that the correlations do not evolve as do those of the 2D Ising antiferromagnets ErBa2Cu3O7 and K2CoF4. Above T(N), magnetic excitations along the b axis that follow the dispersion relation of a 1D ferromagnet with a gap of 3.7 meV have been observed.

Pub. in Physical Review B 47, n14 p8996-9000, 1 Apr 93.

Keywords: Joseph junctions, Lead(Metal), Metal films, Thin films, Flux pinning, Superconductors, Reprints, *Abrikosov vortices, Thermal activation.

Thermally activated hopping of a single Abrikosov vortex has been investigated for a thin Pb film that was decorated with an artificial pinning structure. To determine the location of the vortex, the Pb film is fabricated to be one electrode of a cross-strip superconductor/normal-metal/insulator/superconductor (SNIS') Josephson junction. Distortions in the Fraunhofer pattern specify the vortex location. As the temperature is raised toward T(c), the vortex depins from the artificial pinning site and reproducibly moves through the same sequence of other pinning sites before it leaves the function area of the Pb film. The first thermal depinning occurs when the order parameter of the bulk superconductor is about 20% of the T = O value. The trajectory is not random.

Magnetic Field Dependence of the Critical Current Anisotropy in Normal Metal-YBa2Cu3O7-delta Thin Film Bilayers.
Final rept.
R. H. Ono, L. F. Goodrich, J. A. Beall, M. E. Johansson, and C. R. Reintsema. 1991, 3p.
Pub. in Applied Physics Letters 58, n11 p1205-1207 1991.

Keywords: *YBCO superconductors, *Critical current, *Superconducting films, High temperature superconductors, Magnetic fields, Current density, Metal films, Thin films, Anisotropy, Laser ablation, Interfaces, Silver, Reprints, *Yttrium barium cuprates, Bilayers.

We have measured the transport critical current density (J(c)) in epitaxial-quality films of YBa2Cu3O(7-delta) which were covered by thin (10 nm) Ag films. The films, both with and without Ag, had J(c) values greater than 10(exp 6) A/sq cm in liquid nitrogen. The effect of the Ag was to greatly reduce the dependence of J(c) on external magnetic fields, but only in the case where the field was oriented in the plane of the film perpendicular to the c axis. It is unlikely that the effect is simply due to altered surface pinning, although qualitative agreement with critical state models is observed.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 29, n2 p1265-1275 Mar 93.

Keywords: *Magnetic films, Magnetic recording, Magnetic anisotropy, Thin films, Magnetostatics, Cobalt alloys, Reprints, Micromagnetic models, Exchange interactions.

A micromagnetic model of dual-layer magnetic-recording thin films is described. The model, which is capable of simulating magnetic layers having different magnetic and geometric properties, is applied to the study of the magnetic properties of dual-layer media characterized by a three-dimensional isotropic distribution of anisotropy axes in both layers, using parameters typical of cobalt-alloy films. In the absence of exchange interactions between the layers, a correlation is found between squareness ratios, average magnetostatic energy densities, and structural dimensions of the media. An in-phase magnetization reversal of the layers is found to occur with increasing interlayer exchange

coupling. A complex relationship is found between coercivity and media parameters.

J. O. Oti, and P. Rice. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p5802-5804, 15 May 93.

Keywords: Electron tunneling, Magnetic films, Simulation, Images, Reprints, *Magnetic force microscopy, *Garnet films, Micromagnetics.

A micromagnetic model simulating the images produced by tunneling stabilized magnetic force microscopy is described. The images are related to the force interactions between the fringing fields from the imaged surface and stray fields from the sensing probe. The model, which allows for variations in the magnetization states of the probe, is used to examine the dependence of the interaction forces on varying probe-film separations for a magnetic garnet film. The results show that the images are sensitive to separation and that the changing probe magnetization plays an important role in determining the final image.

Keywords: *Magnetic films, Thin films, Cobalt alloys, Nickel alloys, Magnetostatics, Chromium, Reprints, *Micromagnetic models, Exchange interactions, Multilayers.

A micromagnetic model has been used to characterize the magnetic properties of dual-layer magnetic films. The model calculations, with experimentally determined input parameters, have been compared with measurements on fabricated Co alloy dual-layer films. Calculations are done with a more general version of a previous micromagnetic model, modified to allow the variation of certain media parameters which were previously held constant. Each of the experimental media consists of a bilayer of 30-nm-thick Co(0.75) Ni(0.25) magnetic films separated by a Cr decoupling layer. The calculations predict a split in the coercivities of the layers for small Cr thicknesses which is observed experimentally. The model correlates an observed increase in media squareness ratio and coercivity, as the Cr thickness is increased, with diminishing exchange and magnetostatic interactions between the magnetic layers.

Variation in Magnetic Properties of Cu/Fcc (001) Sandwich Structures.
Final rept.
W. Schwarzacher, J. Penfold, I. Jacob, R. F. Willis, W. Allison, R. C. Ward, and W. F. Egelhoff. 1989, 4p.
Pub. in Solid State Communications 71, n7 p563-566 1989.

Keywords: Polarization(Spin alignment), Magnetic moments, Fcc lattices, Sandwich structures, Magnetization, Copper, Magnetic films, Metal films, Thin films, Epitaxy, Reprints, *Ion films, Ultrathin films, Neutron reflection.

Spin-polarized neutron reflection is used to determine the magnetization of ultrathin epitaxial fcc Fe films sandwiches by Cu (001). A 3.0 ML film had a measured average magnetic dipole moment per atom of 1.9 + or - 0.6 Bohr magnetons/atom which is the highest value yet observed for an fcc Fe film and is consistent with the high spin-moment phase predicted for bulk fcc iron. This state appears to be unstable since increasing the film thickness or using a higher growth temperature leads to a considerable decrease in the observed moment.

Pub. in Physical Review B 49, n1 p368-377, 1 Jan 94.

Keywords: *Magnetoresistance, *Superlattices, Boltzmann equation, Chromium, Copper, Iron, Reprints, *Interface roughness, Magnetic multilayers.

The Boltzmann equation is solved for a system consisting of a ferromagnetic-normal-metallic multilayer. The in-plane magnetoresistance of Fe/Cr and Fe/Cu superlattices is calculated for (1) varying interfacial geometric random roughness with no lateral coherence, (2) correlated (quasiperiodic) roughness, and (3) varying chemical composition of the interfaces. The interplay between these three aspects of the interfaces may enhance or suppress the magnetoresistance, depending on whether it increases or decreases the asymmetry in the spin-dependent scattering of the conduction electrons. Properties of the interfaces relevant to the giant negative magnetoresistance are discussed.

Keywords: *Invar, Iron alloys, Nickel containing alloys, Polarization characteristics, Polarized beams, Neutron beams, Spin waves, Temperature dependence, Single crystals, Amorphous materials, Comparative evaluations, Reprints, *Magnetic excitations.

Triple-axis inelastic polarized neutron measurements have been performed as a function of temperature on a single crystal of the Invar alloy Fe(65)Ni(35) to distinguish longitudinal from transverse magnetic excitations in the magnetically ordered phase. Well below the Curie temperature of 501 K the magnetic excitation spectrum is dominated by conventional transverse spin-wave excitations, which in fact follow the predictions of spin-wave theory very well. In particular, we find no evidence for propagating longitudinal excitations in this system, ir, sharp contrast to the behavior observed in the amorphous Invar Fe(86)B(14) material as well as the non-Invar amorphous system Fe(40)Ni(40)P(14)B(6).

J. Moreland, A. F. Clark, R. J. Soulen, and J. L. Smith. 1994, 2p.
Pub. in Physica B 194-196, p1727-1728 1994.

Keywords: *Energy gap, *Superconductors, Superconducting junctions, Temperature dependence, BCS theory, Reprints, *Uranium beryllium, Point contacts, Uranium intermetallics, Beryllium intermetallics.

The superconducting energy gap, Delta, of bulk UBe13 was measured as a function of temperature. Junctions were made by breaking a narrow region of a specimen in a vacuum and then repositioning the broken ends to form a mechanically adjustable break junction point contact. We concluded that the 2 Delta(O)/k(B)T(c) = 4.2 by fitting the data to the BCS form, assuming a T(c) of 0.80 K.

Spectroscopic Ellipsometry Determination of the Properties of the Thin Underlying Strained Si Layer and the Roughness at SiO2/Si Interface.
Final rept.
N. V. Nguyen, D. Chandler-Horowitz, P. M. Amirtharaj, and J. G. Pellegrino. 1994, 3p.
Pub. in Applied Physics Letters 64, n20 p2688-2690, 16 May 94.

Keywords: *Silicon dioxide, *Oxide films, Dielectric films, Ellipsometry, Substrates, Strains, Silicon, Reprints, *Interface roughness.

The existence of both the strain and microroughness at the interface of thermally grown SiO2 films on Si was ascertained unambiguously for the first time by high accuracy spectroscopic ellipsometry. The dielectric function of the interface was determined by a comprehensive data analysis procedure. By carefully examining the dielectric function obtained by our model, the strain was seen to cause a red shift of 0.042 eV of the interband critical point E(1) compared with the bulk silicon value. The thickness of the interface region was found to be 2.2 nm of which a significant part is due to the strain.

Spot-Profile-Analyzing LEED Study of the Epitaxial Growth of Fe, Co, and Cu on Cu(100).
Final rept.
G. L. Nyberg, M. T. Kief, and W. F. Egelhoff. 1993, 11p.
Pub. in Physical Review B 48, n19 p14 509-14 519, 15 Nov 93.

Keywords: *Epitaxial growth, *Cobalt, *Copper, *Iron, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Temperature dependence, Thermal diffusion, Metal films, Thin films, Microstructure, Substrates, Reprints, Low energy electron diffraction, Henzler rings, Ultrathin films.

The structure of epitaxial films of Fe, Co, and Cu grown at 80-300 K on Cu(100) has been investigated using a spot-profile-analyzing low-energy electron-diffraction (LEED) instrument. In all three systems rings appear around the substrate LEED spots, although the rings differ in intensity and in diameter depending upon the variables of film thickness and deposition temperature. Rings of this type have been studied extensively by Henzler et al and correlated with the mean separation between islands. Much can be inferred about the growth mechanism through a study of these Henzler rings. The rings contract radially with increasing deposition temperature or with increasing annealing temperature as thermally activated diffusion permits the formation of larger islands with greater distances between them. The value of the mean separation suggests that upon consideration these atoms do not come to rest at the immediate site of impact but instead experience some very transient type of mobility associated with the impact and accommodation process.

Pub. in Physical Review B 49, n20 p14 564-14 572, 15 May 94.

Keywords: *Epitaxial growth, *Chromium, *Iron, Scanning electron microscopy, Scanning tunneling microscopy, Polarization characteristics, Temperature range 0273-0400 K, Exchange interactions, Metal films, Magnetization, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning electron microscopy with polarization-analysis (SEMPA) measurements of the dependence of the oscillations of the exchange coupling in Fe/Cr/Fe(100) structures on the Cr growth temperature are correlated with the thickness fluctuations in Cr films measured by scanning tunneling microscopy (STM) at similar growth temperatures. Layer-by-layer growth was observed by STM for Cr deposition on very flat Fe(100) whiskers at deposition temperatures = or > 300 C. The SEMPA measurements of the magnetization of the Fe overlayer as a function of Cr spacer-layer thickness at this temperature could be simulated well by oscillatory coupling with periods 2.105 + or - 0.005d and 12 + or - 1d, where d is the layer spacing. Rougher Cr growth, limited by diffusion kinetics, occurs at lower growth temperatures giving a distribution of thicknesses in the growth front as determined by STM. We modeled the Fe magnetization for lower-temperature Cr growth by assuming that the exchange coupling at each discrete Cr thickness is the same as found for layer-by-layer growth. Important characteristic length scales and the role of biquadratic coupling in the SEMPA measurements are addressed.

Pub. in Jnl. of Applied Physics 75, n10 p6072-6074, 15 May 94.

Keywords: *Platinum containing alloys, *Iron alloys, Temperature dependence, Neutron scattering, Inelastic scattering, Single crystals, Spin waves, Reprints, *Magnetic excitations.

We have performed inelastic neutron scattering measurements of the long-wavelength spin wave excitations of both ordered and disordered Fe(72)Pt(28) single crystals below their critical temperatures, T(C) = 510 and 375 K, respectively. The spin waves followed the expected E = D(q squared) dependence, and the temperature-dependent spin stiffness D decreased as T/T(C)(exp 5/2), as expected for an isotropic ferromagnet. The extrapolated zero-temperature spin stiffness was D = 98(4) meV (A squared) and 107(1) me V (A squared) for the disordered and ordered alloy, respectively. These values are significantly higher than the zero-temperature stiffness as determined by magnetization measurements.

The techniques of atom optics can be applied during the deposition of atoms onto a surface to produce nanostructures. A laser is used to form a standing wave intensity pattern in front of the substrate. An atom beam, which has been collimated by optical means, is focused onto the substrate by dipole forces from the standing wave pattern so as to deposit a series of lines spaced by half the laser wavelength. We describe the fabrication of a Cr nanograting formed using this new technique. The experimental arrangement for deposition and the optical collimation of the atom beam are described. Scanning electron microscopy (SEM) and atomic force microscopy (AFM) images of the resulting nanostructures are presented.

Effect of a Crystal Monochromator on the Local Angular Divergence of an X-Ray Beam.
Final rept.
R. D. Spal. 1994, 7p.
Pub. in Acta Crystallographica A50, p295-301 1994.

Keywords: *X-ray monochromators, *X-ray optics, X-ray diffraction, Synchrotron radiation, Incident radiation, Divergence, Asymmetry, Collimation, Reprints.

The performance of an X-ray optical system often depends critically on the local angular divergence of the X-ray beam. For example, in systems for radiography, tomography and diffraction topography, the angular divergence of the incident beam at a point in the sample determines the limiting spatial resolution. In this paper, formulas are derived for the local divergence in the diffracted beam of the non-dispersive asymmetric reflection double-flat-crystal monochromator, illuminated by synchrotron or characteristic radiation. The formulas are analyzed to determine the general behavior of the local divergence as a function of the asymmetry factors of the crystal reflections. For synchrotron radiation, one surprising conclusion is that the local divergence of the magnifying monochromator is always greater than that of the symmetric monochromator, significantly so for even moderate magnification factors.

Exchange Coupling in Magnetic Heterostructures.
Final rept.
M. D. Stiles. 1993, 21p.
Pub. in Physical Review B 48, n10 p7238-7258, 1 Sep 93.

Keywords: Exchange interactions, Fermi surfaces, Oscillations, Reprints, *Magnetic heterostructures, Magnetic multilayers, Exchange coupling.

Many structures consisting of magnetic layers separated by a nonmagnetic spacer layer show an oscillatory exchange coupling. This behavior is explained in terms of a simple model that shows that the Fermi surface of the spacer-layer material is responsible for the oscillatory coupling. The periods of the oscillatory coupling are set by extremal spanning vectors of the Fermi surface of the spacer-layer material. The strength of the coupling depends both on the geometry of the Fermi surface and on the reflection amplitudes for electrons scattering from the interfaces between the spacer layers and the magnetic layers. To test this and related models, the extremal spanning vectors and the associated Fermi-surface geometrical factors have been calculated for a large set of spacer-layer materials and interface orientations. These models are at least consistent with the experimental data. All measured oscillation periods are consistent with the calculated periods, but particularly for transition metals there are many more periods calculated than are seen experimentally.

Growth of Iron on Iron Whiskers.
Final rept.
J. A. Stroscio, and D. T. Pierce. 1994, 6p.
Pub. in Jnl. of Vacuum Science and Technology B 12, n3 p1783-1788 May/Jun 94.

Keywords: *Epitaxial growth, *Iron, Whiskers(Single crystals), Scanning tunneling microscopy, Electron diffraction, Surface roughness, Surface diffusion, Temperature range 273-400 K, Temperature range 400-1000 K, Temperature dependence, Metal films, Thin films, Islands, Scaling, Reprints.

Real space views of the homoepitaxial growth of Fe on Fe(001) whiskers is reported, observed by scanning tunneling microscopy (STM), during the initial stages of growth. Scaling of the Fe island sizes and separation distribution are observed as a function of the diffusion rate to the deposition rate. A measure of the surface diffusion of the Fe atoms is obtained over the temperature range of 20-250 C from the temperature dependence of the island density. The effect of the diffusion kinetics is also observed in the surface morphology as a decrease in surface roughness with increasing temperature in thin Fe films. A comparison of real and reciprocal space techniques is obtained from a comparison of STM images and reflection-high-energy-electron-diffraction measurements during growth.

Keywords: *Epitaxial growth, *Chromium, Scanning tunneling microscopy, Whiskers(Single crystals), Temperature range 400-1000 K, Temperature dependence, Electron diffraction, Exchange interactions, Film thickness, Metal films, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning tunneling microscopy (STM) and reflection high-energy electron diffraction (RHEED) were used to study the epitaxial growth of Cr on Fe(001) whiskers as a function of the Fe whisker temperature during growth. The STM images give real space views of the morphology of Cr growth, which can be correlated with the nature of the RHEED intensity oscillations. Layer by layer growth is found for Cr deposition on an Fe(001) surface at 300 C, and very rough growth, limited by diffusion kinetics, is observed at lower temperatures. The variation in the interlayer exchange coupling in Fe/Cr/Fe sandwiches as a function of the thickness of the Cr interlayer, which has been found to depend strongly on the growth temperature of the Cr interlayer, can be explained by the thickness fluctuations determined from the STM measurements of Cr films grown at different temperatures.

Pub. in Jnl. of Applied Physics 75, n10 p6437-6439, 15 May 94.

Keywords: *Epitaxial growth, *Gold, *Iron, Scanning electron microscopy, Polarization characteristics, Electron diffraction, Exchange interactions, Fermi surfaces, Metal films, Thin films, Substrates, Reprints, Magnetic multilayers, Exchange coupling.

Scanning electron microscopy with polarization analysis was used to investigate the interlayer exchange coupling in Fe/Au/Fe(100) sandwich structures. The films were epitaxially grown on single-crystal Fe(100) substrates. Electron diffraction measurements revealed that the Au spacer film grew with a surface reconstruction consistent with that observed for bulk Au crystals. The exchange coupling oscillates between primarily ferromagnetic and antiferromagnetic coupling for Au spacer layers up to 65 layers (13 nm) thick, but a significant biquadratic coupling component was also observed. The oscillatory coupling exhibited two components with periods of 2.48 + or - 0.05 layers (0.506 + or - 0.010 nm) and 8.6 + or - 0.3 layers (1.75 + or - 0.06 nm). The measured periods are in excellent agreement with those calculated from spanning vectors of the Au Fermi surface.

Keywords: *Gallium arsenides, *Photoluminescence, *Band structure of solids, Carbon additions, Doped crystals, Energy gap, Fermi level, Emission spectra, Epitaxy, Reprints, *Interband absorption, Bandgap narrowing, Density of states.

Heavily carbon-doped GaAs samples with doping levels as high as 4.1 X 10(exp 20)/cc were studied by photoluminescence and luminescence excitation spectroscopies. Luminescence and absorption band gaps were determined, from which the positions of the Fermi levels were deduced. A variety of factors which affect the observed emission spectra, including diffraction and refraction of the luminescence, substrate effects, and lattice contraction in the carbon-doped epilayer, were examined. A first-principles calculation was performed to calculate the density of states, the band gap, the Fermi energy, and the emission spectrum. Comparison of the calculation results with the experiments shows that the theoretical model we use is a good approximation for describing band structure for doping levels higher than 10(exp 20)/cc. However, the discrepancy between the measured and the calculated emission spectra indicates that the usual assumptions such as constant momentum matrix elements and quasiequilibrium distribution of photoexcited electrons in the conduction band may not be appropriate in treating the transition processes in highly degenerate semiconductors.

Keywords: *Surfaces, Monte Carlo method, Cubic lattices, Topology, Simulation, Reprints, *Self-avoiding surfaces, Oct trees.

With Monte Carlo simulation, we study closed self-avoiding surfaces (SAS) of arbitrary genus on a cubic lattice. The gyration radius and entropic exponents are v = 0.506 + or - 0.005 and theta = 1.50 + or - 0.06, respectively. Thus, SAS behave like lattice animals (LA) or branched polymers at criticality. This result, contradicting previous conjectures, is due to a mechanism of geometrical redundancy, which is tested by exact renormalization on a hierarchical vesicle model. By mapping SAS into restricted interacting site LA, we conjecture v(sub theta) = 1/2 phi(sub theta) = 1, and theta(sub theta) = 3/2 at the LA theta point.

Keywords: *Amorphous silicon, *Surface analysis, *Silicon, Radio frequency discharge, Scanning tunneling microscopy, Gallium arsenides, Topography, Substrates, Single crystals, Reprints, Nanostructures.

A scanning tunneling microscope has been used to study the topography of the as-grown surface of device-quality, intrinsic, hydrogenated amorphous silicon deposited by rf discharge from silane. The substrates were atomically flat, oxide-free, single-crystal silicon or gallium arsenide. No evidence for island formation or nanoscale irregularities was seen in studies of 100-A-thick films on either silicon or gallium arsenide. The topography of 1000- and 4000-A-thick films has much variation; many regions can be characterized as 'rolling hills,' but atomically flat areas have also been observed nearby. Generally, it appears that surface diffusion plays a role in smoothing the film topography. In most regions, the observed slopes were 10% or less from horizontal, but some steep-sided valleys, indicating incipient voids, were observed. The effect of the finite size of the scanning tunneling microscope probe tip is considered; this has an effect on the observed images in some cases.

The surface topography of YBa2Cu3O(7-delta) thin films has been studied with both atomic force microscopy (AFM) and scanning tunneling microscopy (STM). The AFM images reveal a high density of small distinct nanoparticles, 10-50 nm across and 5-20 nm high, which do not appear in STM images of the same samples. In addition, we have shown that scanning the STM tip across the surface breaks off these particles and moves them to the edge of the scanned area, where they can later be imaged with the AFM.

Pub. in Physical Review B 46, n17 p10 613-10 622, 1 Nov 92.

Keywords: *Crystal defects, *Crack propagation, *Greens function, Crystal dislocations, Hexagonal lattices, Fractures(Materials), Numerical solution, Interfaces, Reprints.

This paper explores the use of lattice Green's functions for calculating the static structure of defects in lattices, in that the atoms of the lattice interact with their neighbors with an arbitrary nonlinear (short-range) potential. The method is hierarchical, in which Green's functions are calculated for the perfect lattice, for increasingly complicated defect lattices, and finally the nonlinear structure problem is iterated until a converged solution is found. As an illustration of the method, we report numerical calculations for an interfacial crack emitting dislocations from an interface between two joined two-dimensional hexagonal lattices. The supercell size was 4 x 10(exp 6), and the crack length was 101 lattice spacings. After the Green's functions were obtained for the defective lattice, the dislocation and crack structures were obtained in a minute or less, making possible detailed studies of the defects with various external loads, force laws, defect relative positions, etc., with negligible computer time.

Keywords: Principle components analysis, Least squares method, Data reduction, Data analysis, Cluster analysis, Kernel functions, Superconductors, Reprints, *Livermore loops.

This paper is devoted to an analysis of the data from the Livermore kernels benchmark. We will show that in the sense of least squares prediction the dimension

of these data is rather small; a reduction of the data to dimension four has about the same predictive power as the original data. Two techniques are used that reduce the 72 kernel timings for each machine to a few scores by which the machine is characterized. The first is based on a principal component analysis, the second on a cluster analysis of the kernels. The validity of the reduction to lower dimension is checked by various means. The possible use of the Livermore data to predict the running time of larger codes is demonstrated.

Keywords: Scanning tunneling microscopy, Room temperature, Indium antimonides, Gallium arsenides, Adsorbates, Semiconductors, Diffusion, Cesium, Surfaces, Alkali metals, Reprints, *Atomic manipulation, Nanostructures, Nanoclusters.

A general method of manipulating adsorbed atoms and molecules on room-temperature surfaces with the use of a scanning tunneling microscope is described. By applying an appropriate voltage pulse between the sample and probe tip, adsorbed atoms can be induced to diffuse into the region beneath the tip. The field-induced diffusion occurs preferentially toward the tip during the voltage pulse because of the local potential energy gradient arising from the interaction of the adsorbate dipole moment with the electric field gradient at the surface. Depending upon the surface and pulse parameters, cesium (Cs) structures from one nanometer to a few tens of nanometers across have been created in this way on the (110) surfaces of gallium arsenide (GaAs) and indium antimonide (InSb), including structures that do not naturally occur.

The influence of the ionic size of the lanthanides R on melting relations of Ba2RCu3O(6+x), where R=Y, Eu and Nd, was studied and compared with that of a high T(c) superconductor mixed-lanthanide phase Ba2(Y(0.75)Eu(0.125)Nd(0.125))Cu3O(6+x). These materials have been characterized by a variety of methods including scanning electron microscopy (SEM). Single phase samples of Ba2(Y(0.75)Eu(0.125)Nd(0.125))Cu3O(6+x) were annealed at 1004, 1040, 1052, 1060, 1078, 1107 and 1160 C and quenched into a helium gas container cooled by liquid nitrogen. The SEM micrographs of these samples showed the progressive changes in features of the microstructures from sintering and grain growth through melting and then recrystallization from the melt. The addition of the SEM technique in conjunction with X-ray diffraction has been helpful in the study of phase equilibria in this system.

Pub. in Physical Review B 41, n7 p4220-4223, 1 Mar 90.

Keywords: *High temperature superconductors, *YBCO superconductors, *Crystal structure, Temperature range 0065-0273 K, Room temperature, X-ray diffraction, Single crystals, Orthorhombic lattices, Gold additions, Thermomechanics, Reprints, *Yttrium barium cuprates, Detwinning.

A twin-free single crystal of YBa2Cu3O(6+x) has been studied at room temperature and 115 K by x-ray diffraction analysis. The crystal was grown from an Y-Ba-Cu-O melt in a gold crucible, leading to a 2% substitution of Au for Cu. Twins were removed from the as-grown crystal by a novel thermomechanical process, resulting in an orthorhombic (Pmmm), single-domain crystal. Oxygen positions and occupancies in the Cu-O basal plane have been refined, showing that the O(5) site is completely vacant, and the O(4) atoms are offset from the crystallographic mirror plane positions by 0.15 A in a zig-zag fashion. Gold, which is a common impurity in crystals grown by the present technique, was found to occupy Cu(1) sites only. Weak superlattice reflections suggest a possible three-dimensional ordering of O and/or Au. To our knowledge, this paper reports the first high-resolution x-ray study of an intentionally detwinned, superconducting YBa2Cu3O(6+x) single crystal.

Keywords: *Rare earth compounds, *Crystal structure, *Crystal chemistry, Orthorhombic lattices, X-ray diffraction, Barium oxides, Reprints, Phase equilibrium.

The compounds BaR2O4, where R = La, Nd, Sm, Gd, Eu, Dy, Ho and Er have been prepared from a stoichiometric mixture of BaCO3 and lanthanide oxides, and characterized by X-ray powder diffraction. Standard X-ray patterns of these phases were prepared. In general, BaR2O4 crystallizes in the pervoskite-related CaFe2O4 structure which is orthorhombic with a space group Pnam. The cell parameters of these compounds from R = Er to La were found. When R = Tm, Lu and Yb, the BaO R2O3 composition produced the mixture Ba3R4O9 and the unreacted lanthanide oxide. Under the present experimental conditions, the compound BaRO3 was the predominant component when R = Ce, Pr, and Tb.

Keywords: *High temperature superconductors, *Dysprosium ions, Neutron scattering, Two dimensional, Antiferromagnetism, Reprints, *Dysprosium barium cuprates, *Magnetic ordering, Bilayers.

Neutron scattering has been used to investigate the magnetic ordering of the Dy ions in the superconducting (T(c) approx = 60 K) Dy2Ba4Cu7O15 (2:4:7) material. A modulated saw-tooth scattering profile is observed, indicative of a coupled-bilayer two-dimensional (2D) system in which the nearest-neighbor Dy spins within the a-b plane are coupled antiferromagnetically, with the moment direction along the c axis. The a-b-plane spin configuration is identical to the one which has been observed for the related DyBa2Cu3O7 (1:2:3) and Dy2Ba4Cu8O16 (2:4:8) materials. We anticipate that a similar coupled-bilayer 2D behavior should occur in other R2Ba4Cu7O15 systems (R = rare-earth element, except Er) which exhibit the same a-b-plane spin configuration as the Dy.

Keywords: *Potassium tantalates, *Thermal expansion, Temperature dependence, Cryogenic temperature, X-ray diffraction, Neutron scattering, Inelastic scattering, Niobium additions, Lattice parameters, Cubic lattices, Single crystals, Anomalies, Reprints, *Potassium tantalate niobates, Phonon dispersion.

The temperature dependences of the lattice constant and TA phonon dispersion in dilute single crystals of KTa(1-x)Nb(x)O3 with 0.012 less than or equal to x less than or equal to 0.09 have been studied using x-ray diffraction and neutron scattering techniques, respectively. For x less than or equal to 0.06 an anomalous low-temperature expansion of the cubic lattice parameter is observed at a temperature T(sub min) that increases monotonically with Nb concentration, with no measurable change in symmetry down to 10 K. Concurrent with T(sub min) is a monogeneous broadening of the x-ray Bragg peaks which persists down to 10 K, as well as a strong relief of extinction seen by neutron diffraction. Inelastic neutron scattering measurements reveal that the coupling between TA and TO modes, first observed in pure KTaO3, is both wavevector and concentration dependent.

Pub. in Physical Review B 49, n17 p11 967-11 978, 1 May 94.

Keywords: *Terbium, Transition temperature, Neutron scattering, Reprints, *Magnetic correlation lengths.

Extensive neutron-scattering experiments have been performed in order to characterize the nature of the two correlation lengths observed in Tb, a phenomenon common to Ho as well as SrTiO3. In the vicinity of the transition temperature, each of those crystals exhibits an anomalous two-component q profile in the critical scattering; the usual broad peak and an unexpected additional narrow peak. In order to clarify the spatial origin of the narrow component, the (0,0,delta) magnetic satellite peak of Tb has been closely examined using a very narrow neutron beam realized by a high spatial resolution reflectometer at the National Institute of Standards and Technology, which can produce well-defined beam widths of 0.3 mm and less. The small scattering angle (theta approx = 1.35 deg) and the narrow beam width result in an extraordinarily fine q and E resolution. As recently reported, we have confirmed that the intensity of the narrow component is enhanced near the edge of the crystal; it demonstrates that the major part is located within the near surface volume or 'skin' of the crystal.

Using a mean-field approach, Carrico and Camley (Phys. Rev. B 45, 13117 (1992)) have determined the magnetic behavior expected for superlattices consisting of uniaxial antiferromagnets. They state that the resulting phase transitions in a real system cannot be observed by standard, bulk measurements of the magnetization. In fact, the predictions of their model can be explicitly tested using neutron-diffraction techniques, which have already been applied toward the study of antiferromagnetic Ni0/CoO and Fe3O4/NiO superlattices.

Keywords: *High temperature superconductors, *High-TC superconductors, *Magnetization, Critical current, Current density, Surface barrier, YBCO superconductors, Reprints, Yttrium barium cuprates.

An extended critical state model which includes the effects of bulk critical current density, equilibrium magnetization and surface barrier is developed for the magnetization of superconductors. The equilibrium magnetization and surface barrier are modeled by an applied field dependent surface supercurrent density j(s)(H), whose presence changes the boundary field of the bulk. The volume supercurrents flow with a density equal to the internal field dependent critical current density J(c)(Hi). The magnetization M is produced by both supercurrents. For the M(H) curve computation, exponential-type J(c)(Hi) and j(s)(H) values are used for the general case of an infinite sample of rectangular cross-section. A comparison between the experimental magnetization curves of a sintered YBa2Cu3O7 superconductor at 76 K and the model fit shows that j(s)(H) is null for the coupling matrix, whereas a non-zero j(s)(H) is needed for the grains. The model fit for the irreversible magnetization of the grains is improved by including a surface barrier to the entry and exit of flux.

M. J. Chester, and T. Jach. 1993, 9p.
Pub. in Physical Review B 48, n23 p17-262 - 17-270, 15 Dec 93.

Keywords: *X-ray photoelectron spectroscopy, *Chemical composition, *Thin films, Concentration(Composition), Grazing incidence, Gallium arsenides, Gallium oxides, Interfaces, Reprints, Total external reflection, Multilayers.

At the energies of interest in x-ray photoelectron spectroscopy (XPS), total external reflection of the x-ray beam occurs from a smooth surface at small incidence angles. The penetration of the x rays into the material is strongly attenuated at these angles and surface sensitivity is enhanced in the XPS yields. As the incidence angle is increased, the x rays penetrate more deeply into the material and the XPS signal contains a larger contribution from the bulk. By exploiting this angle-dependent x-ray penetration depth, it is possible to obtain depth-dependent XPS spectra from which the concentration profiles of the photoelectron-emitting atoms can be inferred. In this paper we develop a general formalism for calculating grazing-incidence XPS (GIXPS) yields from multilayer media. A quantitative analysis of GIXPS spectra acquired from an oxidized GaAs(100) surface that was annealed to remove oxidized As will be discussed. The results show that this annealed oxide is composed of Ga2O3 and that the oxide-GaAs substrate interface is rough.

Keywords: *Crystal growth, *Solidification, Liquid-solid interfaces, Binary alloys, Morphology, Stability, Reviews, Reprints, Crystal-melt interface.

During crystal growth, a smooth crystal-fluid interface is subject to instability and may become cellular or dendritic. Linear morphological stability theory described the conditions under which the interface becomes unstable. The theory is applicable to first order phase transformation in general, but in this article we will treat the growth of a crystal from a liquid phase. There are many reviews of morphological stability. In this article we will review the basic theory and discuss extension of the theory with emphasis on recent developments. A number of important topics will not be treated in this article, but will be covered in other articles in this volume. Effects of fluid flow are treated in the Chapter by Davis. Dendritic growth is treated in the Chapter by Billia and Trivedi. We will also assume that effects of crystalline anisotropy are small enough that facets or missing interface orientations do not occur.

Keywords: *Buckminsterfullerene, *Fullerenes, *Epitaxial growth, *Single crystals, Orientation(Direction), X-ray diffraction, Gallium antimonides, Thin films, Substrates, Antimony, Reprints, Low energy electron diffraction, Carbon films.

Single crystal thin films of (111) oriented C(60) are grown on epitaxial layers of single crystal antimony. The C(60)/Sb epitaxy is confirmed by low-energy electron diffraction which indicates that the (left bracket) (1-10) (right bracket) in-plane directions are parallel in the two layers. X-ray diffraction shows that the C(60) film is entirely (111) oriented and of high quality with sharp Bragg peaks and narrow mosaic spread. In this study, the Sb films were grown on GaSb, to which they are lattice matched; however, as Sb can be epitaxially grown on surfaces with a large lattice mismatch, this technique may be applied to integrate C(60) single crystals onto many substrates or devices with a surface having sixfold symmetry.

Keywords: *Superconductors, Superconducting junctions, Symmetry breaking, Asymmetry, Reprints, Single electron tunneling, Andreev reflection.

We have measured at low temperatures the current through a submicrometer superconducting island connected to two normal metal leads by ultrasmall tunnel junctions. As the bias voltage is lowered well below twice the superconducting energy gap, the current changes from being e periodic with gate charge to 2e periodic. This behavior is clear evidence that there is a difference in the total energy between the ground states of an even and odd number of electrons on the island. The 2e-periodic current peaks are the first observation of the Coulomb blockade of Andreev reflection.

Practical electromechanical properties of a high T(c) superconductor have been measured for Ag-sheathed Bi2Sr2Ca1Cu2O(8+x) superconductors at high magnetic fields up to 25 T. A melt-processed powder-in-tube Bi2Sr2Ca1Cu2O(8+x) conductor had an irreversible strain of 0.2% for the onset of permanent damage and a 50% critical-current-degradation strain of 0.36%. Measurements of a discontinuous filament melt-processed Ag-sheathed Bi2Sr2Ca1Cu2O(8+x) superconductor show an irreversible strain of 0.6% and a 50% degradation strain of about 1%. These strain damage thresholds are about an order of magnitude higher than for high-temperature superconductors made by bulk sintering and are reaching practical values for magnet design.

Pub. in Applied Physics Letters 63, n13 p1774-1776, 27 Sep 93.

Keywords: Atomic force microscopy, Vapor phase epitaxy, Electron diffraction, Gallium arsenides, Substrates, Reprints, *Gallium indium phosphides, *Surface topography, Nomarski microscopy, Epilayers.

Using transmission electron diffraction dark-field imaging, atomic force microscopy (AFM), and Nomarski microscopy, we demonstrate a direct connection between surface topography and cation site ordering in GaInP2. We study epilayers grown by organometallic vapor-phase epitaxy on GaAs substrates oriented 2 deg off (100) towards (110). Nomarski microscopy shows that, we growth proceeds, the surface of ordered material forms faceted structures aligned roughly along left bracket 011 right bracket. A comparison with the dark-field demonstrates that the left bracket 1-11 right bracket and left bracket 11-1 right bracket ordering variants are segregated into complementary regions corresponding to opposite-facing facets of the surface structures. This observation cannot be rationalized with the obvious but naive model of the surface topography as being due to faceting into low-index planes. However, AFM reveals that the facets are in fact not low-index planes, but rather are tilted 4 deg from (100) towards (111)(sub B). This observation explains the segregation of the variants: the surface facets act as local (111)(sub B)-misoriented growth surfaces which select only one of the two variants.

Origin of the Second Length Scale Above the Magnetic Spiral Phase of Tb.
Final rept.
P. M. Gehring, K. Hirota, C. F. Majkrzak, and G. Shirane. 1993, 4p.
Pub. in Physical Review Letters 71, n7 p1087-1090, 16 Aug 93.

Keywords: *Terbium, Neutron scattering, Line shape, Holmium, Reprints, Critical scattering.

High q-resolution neutron-scattering measurements of the critical scattering in Tb above the magnetic-spiral phase transition temperature T(s) exhibit a two-component line shape, as recently documented in Ho. This implies the existence of a second length scale. By using a narrow beam only 300 micrometers wide, and then translating the crystal through the beam, we have established that the origin of the second length scale lies within the near-surface volume or 'skin' of the Tb crystal. This is manifested by a large enhancement of the scattering intensity at the c-axis face of the cube-shaped crystal.

R. B. Goldfarb. 1993, 1p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of U.S.-Japan Workshop (8th) on High-Field Superconducting Materials, Wires and Conductors and Standard Procedures for High-Field Superconducting Wires Testing, Madison, WI., March 17-19, 1993, p72.

Keywords: *Superconducting wires, *Magnetic hysteresis, *Niobium stannides, Temperature range 0000-0013 K, SQUID devices, AC losses, Reprints, *Niobium ten, Multifilaments.

The magnetic hysteresis losses of samples of reacted multifilamentary Nb3Sn superconductor wire in coiled and straight geometries were measured at 4.1 K with a superconducting-quantum-interference-device (SQUID) magnetometer and an extraction dc magnetometer (DCM) for fields perpendicular to the wire axis. There were significant differences in the volume energy dissipation for the various samples. These differences are a function only of the length of the wire samples and are independent of whether the samples are straight segments or coils. As sample length increases from 2.6 mm, losses per total sample volume, for complete field cycles of + or - 3 T, increase nonlinearly from 0.19 to an asymptotic value of 0.43 MJ/cu m. A coiled sample with wire length 3 cm has 97% of the losses of a coiled sample with wire length 15 cm or greater. Losses are very length-dependent below 1 cm.

Keywords: *High temperature superconductors, *Crystal structure, Tetragonal lattices, Neutron diffraction, Oxygen additions, Annealing, Temperature dependence, Reprints, *Mercury barium calcium cuprates.

Neutron profile refinements have been carried out on powders of as-prepared and oxygen annealed samples of the layered HgBa2CaCu2O(6 + delta)(1212) cuprate superconductors. The crystal structure is tetragonal P4/mmm over the range of temperatures 10 K to 298 K investigated, with no structural transitions of any kind being detected. The extra oxygen that electrically dopes these materials is found to reside in the centered position of the Hg plane, and no other excess oxygen is present in these samples. In addition, we found no conclusive evidence for mixing of the Hg and Cu cations. In the as-prepared sample we found delta = 0.22, while the oxygen content increased substantially to delta = 0.35 with annealing. This extra oxygen had only a small effect on the superconductivity, broadening the transition somewhat and shifting T(c) from 112 K to 120 K. The incorporation of extra oxygen also had the effect of constricting the lattice parameters by about 0.1%. The overall behavior is similar to the single-layer Hg-1201 system.

Pub. in Materials Science Forum 137-139, p103-131 1993.

Keywords: *High-temperature superconductors, *Magnetic susceptibility, *YBCO superconductors, Alternating current, Direct current, Sintered materials, Superconducting films, Single crystals, Flux pinning, Temperature dependence, Thin films, Comparison, Reprints, *Yttrium barium cuprates, Gadolinium barium cuprates, Magnetic field dependence.

Intergranular properties of the sintered superconductor YBa2Cu3O7 have been studied in terms of complex harmonic magnetic susceptibility chi(sub n) = (chi prime)(sub n) - i(chi double prime)(sub n) (n integer) as well as DC susceptibility chi(dc). As functions of temperature T, (chi prime)(sub 1) and (chi, double prime)(sub 1) depend on both the AC magnetic-field amplitude H(ac) and the magnitude of a superimposed DC field H(dc). Only odd-harmonic susceptibilities are observed below the critical temperature, T(c), for zero H(dc) while both odd and even harmonics are observed for nonzero H(dc). With T constant, odd-harmonic susceptibilities are even functions of H(dc), whereas even-harmonic susceptibilities are odd functions of H(dc). In contrast, even-harmonic susceptibilities measured for a GdBa2Cu3O7 thin film and an YBa2Cu3O7 single crystal are not prominent due to missing weak links, whereas odd-harmonic susceptibilities are remarkable. A survey of several models for the harmonic response of superconductors is presented.

Grazing Angle X-Ray Photoemission System for Depth-Dependent Analysis.
Final rept.
T. Jach, M. J. Chester, and S. M. Thurgate. 1994, 4p.
Pub. in Review of Scientific Instruments 65, n2 p339-342 Feb 94.

Keywords: *X-ray photoelectron spectroscopy, *X-ray spectrometers, *Gallium arsenides, *Surface analysis, Grazing incidence, Photoemission, Oxidation, Oxides, Reprints, Depth dependence, Depth profiles.

We have developed an x-ray photoelectron spectrometer system which combines an adjustable grazing incidence angle source with reflected beam detection. When operated about the critical angle, this combination permits a variation of the x-ray penetration depth which can be monitored by means of the reflectivity. At angles of incidence less than the critical angle, the sampling depth of the photoemission is diminished, but the photoemission from the surface is enhanced due to the constructive interference of the incident and reflected x-ray beams. When used with Mg K(alpha) radiation (E(sub gamma) = 1253.6 eV), the spectrometry system obtains useful distributions of chemical species in surface layers of 10-40 A thickness. We present data showing the depth dependence obtained with the spectrometer of different oxides in a sulfide-treated, oxidized GaAs (100) surface.

Keywords: *High temperature superconductors, *YBCO superconductors, *Hydrogen additions, Spin lattice relaxation, Nuclear magnetic resonance, Neutron spectroscopy, Neutron scattering, Inelastic scattering, Relaxation time, Vibrational spectra, Doped materials, Reprints, *Yttrium barium cuprates.

The high temperature superconductor YBa2Cu3O(x) absorbs considerable amounts of hydrogen if it is kept at elevated temperatures in a hydrogen gas atmosphere. In parallel neutron spectroscopic and nuclear magnetic resonance experiments, we studied the vibrational spectra and the spin lattice relaxation time of the protons in YBa2Cu3O(x) samples that were doped with hydrogen due to the absorption of hydrogen gas. Both the vibrational spectra and the spin lattice relaxation time are a sensitive probe for the local environment of the protons. We carried out analogous measurements on samples with a similar proton concentration due to the uptake of water vapor. These experiments demonstrated a totally different local environment of the protons. This fact is a strong indication that the protons absorbed from the hydrogen gas atmosphere did not react with the oxygen of the sample under formation of molecular water.

Grain Alignment and Transport Properties of Bi2Sr2CaCu2O8 Grown by Laser Heated Float Zone Method.
Final rept.
J. Luo, X. P. Jiang, H. M. Chow, T. P. Orlando, D. A. Rudman, M. J. Cima, and J. M. Graybeal. 1991, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p1499-1502 Mar 91.

Keywords: *High temperature superconductors, *BSCCO superconductors, *Grain structure, *Critical current, Grain boundaries, Orientation(Direction), X-ray analysis, Temperature dependence, Transport properties, Zone melting, Float zones, Laser heating, Alignment, Anisotropy, Reprints, *Bismuth strontium calcium cuprates, Magnetic field dependence.

Single phase Bi2Sr2CaCu2O8 bulk superconductor (T(c) approx = 82 K) has been grown by laser heated floating zone method. The samples are highly textured with the grains, typically 100 micrometers in diameter and 0.5 cm long, elongated along the crystal a-axis which is the preferred growth direction. Our X-ray analysis and transport measurements indicate that the b, c axes are also orientated from grain to grain in the plane perpendicular to the growth direction. The upper limit of the misalignment between the grains is estimated to be less than 2 degrees from the measured upper critical field anisotropic ratio. The critical current density for such highly textured polycrystalline is anisotropic and limited mainly by the weak links at the grain boundaries. The grain boundary effects will be discussed on the basis of the measured temperature and magnetic field dependence of the critical current.

Effects of Anneal Time and Cooling Rate on the Formation and Texture of Bi2Sr2CaCu2O8 Films.
Final rept.
M. M. Matthiesen, J. M. Graybeal, T. P. Orlando, J. B. Vander Sande, and D. A. Rudman. 1991, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 27, n2 p1223-1226 Mar 91.

Keywords: *High temperature superconductors, *Superconducting films, *BSCCO superconductors, Time dependence, Cooling rate, Microstructure, Annealing, Reprints, *Bismuth strontium calcium cuprates, Sputtered coatings, Surface texture.

The effects of anneal time and cooling rate on the formation and texturing of superconducting Bi2Sr2CaCu2O8 (BSCCO) films were investigated. Samples were prepared by sputter depositing amorphous BSCCO films, annealing them at 870 C in flowing 20% O2-80% Ar for 30, 60, or 180 minutes and then cooling them. Two cooling rates were investigated: a fast cool of 80 C/min and a slow cool of 9 C/min. It was observed that effective coupling between superconducting 2,212 grains occurs when films exhibit a minimum amount of (001) texturing. In addition, the nucleation and growth kinetics are significantly different for the isothermal and cooling regimes of thermal processing. Consequently, anneal time and cooling rate play distinct roles in the achievement of the appropriate texture and microstructure in the films: longer anneal times increase the volume fraction of the 2,212 phase while slower cooling rates enhance grain growth and texturing.

Keywords: Photon-atom collisions, Atomic force microscopy, Atomic beams, Standing waves, Laser radiation, Line width, Lithography, Substrates, Silicon, Reprints, *Atom optics, *Nanostructures, *Laser deposition, Laser focusing, Chromium atoms.

The ability to fabricate nanometer-sized structures that are stable in air has the potential to contribute significantly to the advancement of new nanotechnologies and our understanding of nanoscale systems. Laser light can be used to control the motion of atoms on a nanoscopic scale. Chromium atoms were focused by a standing-wave laser field as they deposited onto a silicon substrate. The resulting nanostructure consisted of a series of narrow lines covering 0.4 millimeter by 1 millimeter. Atomic force microscopy measurements showed a line width of 65 + or - 6 nanometers, a spacing of 212.78 nanometers, and a height of 34 + or - 10 nanometers. The observed line widths and shapes are compared with the predictions of a semiclassical atom optical model.

Comparison of Elastic and Plastic Contact Models for the Prediction of Thermal Contact Conductance.
Final rept.
T. H. McWaid, and E. Marschall. 1993, 8p.
Pub. in Warme- und Stoffubertragung 28, p441-448 1993.

Keywords: *Contact resistance, *Thermal conductors, Plastic properties, Elastic properties, Plastic deformation, Microhardness, Thermal conductivity, Reprints, *Contact models, Asperity.

Experimentally determined thermal contact resistance (conductance) data are compared with predictions based on two different theories. One of the theories assumes elastic contact, while the other theory is based on the assumption of plastic contact. Even though the high plastic index calculated for the contacting surface suggested that contacting asperities would deform plastically, the experimental data generally agree better with the predictions obtained using the elastic contact model than with the predictions obtained using the plastic contact model.

Pub. in Thallium-Based High-Temperature Superconductors, p569-577 1994.

Keywords: *High temperature superconductors, *Thallium compounds, Bound state, Interfaces, Reprints, *Thallium barium calcium cuprates, *Tunneling spectroscopy, *Electron tunneling spectroscopy.

This chapter focuses on electron tunneling spectroscopy (ETS) of the thallium based high-temperature superconductor (HTS) materials. A summary of published results is included with comments regarding interpretations of each measurement. Other phenomena that may have subsequent bearing on the interpretation of tunneling spectra are addressed briefly including a linear background conductance, Coulomb blockade effects, and bound states at superconductor/normal metal (SN) interfaces. This chapter does not address many of the Josephson like devices based on weak-links, point contacts, microbridges, or step-edge junctions.

Tunneling Stabilized Magnetic-Force Microscopy.
Final rept.
J. Moreland. 1993, 2p.
Pub. in Proceedings of the Annual Meeting of the Microscopy Society of America (51st), Cincinnati, OH., August 2-6, 1993, p1034-1035.

Keywords: Scanning tunneling microscopy, High temperature superconductors, Superconducting films, Magnetic flux, Domain walls, Magnetic recording, Reprints, *Magnetic force microscopy, Bloch walls, Garnet films.

Magnetic force microscopy (MFM) can be done by making a simple change in conventional scanning tunneling microscopy (STM) where the usual rigid STM tip is replaced with a flexible magnetic tip. STM images acquired this way show both the topography and the magnetic forces acting on the flexible tip. The z-motion of the STM piezo tube scanner flexes the tip to balance the magnetic force so that the end of the tip remains a fixed tunneling distance from the sample surface. We present a review of some 'tunneling-stabilized' MFM (TSMFM) images showing magnetic bit tracks on a hard disk, Bloch wall domains in garnet films, and flux patterns in high-T(c) superconductor films. The image resolution of TSMFM is routinely 0.1 micrometer using Au coated magnetic tips cut from Ni or Fe films. Recent results show that a TSMFM resolution of less than 40 nm is possible with micromachined cantilevers coated with a very thin Au-Fe bilayer.

J. Moreland, P. Rice, and A. Wadas. 1993, 4p.
Pub. in Proceedings of the International Workshop on Superconductivity, Hakodate, Japan, June 28-July 1, 1993, p77-80.

Keywords: *Magnetic flux, *Superconductors, Scanning tunneling microscopy, Imaging techniques, Image analysis, Penetration, Reprints, *Magnetic force microscopy.

We are developing a novel form of magnetic force microscopy (MFM) which is well suited for low-temperature imaging of magnetic flux lines penetrating superconductors. This method is based on standard scanning tunneling microscopy (STM) where the usual rigid tunneling tip is replaced with a flexible magnetic tip. We present a discussion of the interpretations of these images which includes theoretical aspects of MFM of flux lines in superconductors and experimental details regarding MFM which we believe are critical for flux imaging.

New Exact Solution of the One-Dimensional Schrodinger Equation and Its Application to Polarized Neutron Reflectometry.
Final rept.
H. Zhang, and J. W. Lynn. 1993, 4p.
Pub. in Physical Review Letters 70, n1 p77-80, 4 Jan 93.

Keywords: *Schrodinger equation, *Superconductors, Penetration depth, One dimensional, Magnetization, Neutron scattering, Reprints, *Polarized neutron reflectometry.

An analytic expression for the polarized neutron reflectivity R(sup +,-) (theta, lambda) from a superconductor with penetration depth lambda is derived as an exact solution of the 1D Schroedinger equation in the continuum limit. The down-spin solution R(sup -) (theta, lambda) reveals a surprising oscillatory dependence on lambda within a narrow angular range immediately above the total reflection angle, and in fact vanishes when lambda and H satisfy certain conditions. This exact solution is applicable to other scattering problems with a general exponential dependence in the potential.

R. Ploessl, J. N. Chapman, M. R. Scheinfein, H. Hoffmann, J. L. Blue, and M. Mansuripur. 1993, 7p.
Pub. in Jnl. of Applied Physics 74, n12 p7431-7437, 15 Dec 93.

Keywords: *Magnetic domains, *Domain walls, Electron microscopy, Metal films, Cobalt, Platinum, Reprints, Micromagnetics, Multilayers.

An analysis of the micromagnetic structure of domains and domain walls in Co/Pt multilayer films is reported. Magneto-optically written domains have been imaged in a scanning transmission electron microscope by using the modified differential phase contrast mode of Lorentz electron microscopy. These have been compared with computer-simulated images based on a two-dimensional model of a circular, perpendicular magnetized domain with a Bloch-like wall structure. Agreement is found for the domain and stray field contrast, but the absence of wall contrast in the experimental images indicates a more complex wall structure

in the multilayer than was assumed by the model. In a further series of calculations the magnetic microstructure of a Co/Pt multilayer was modeled by solving the Landau-Lifshitz-Gilbert equations. These suggest that the wall structure varies throughout the thickness of the multilayer, allowing significant saving of magnetostatic energy through the establishment of flux closure paths close to the walls, and are consistent with experimental observations.

Pub. in Proceedings of NATO Advanced Study Institute on the Science and Technology of Nanostructured Magnetic Materials, Crete, Greece, June 24-July 6, 1990, p117-136 1991.

Keywords: *Rare earth elements, *Superlattices, Magnetic anisotropy, Magnetic films, Magnetic materials, Magnetostriction, Exchange interactions, Neutron diffraction, Metal films, Magnetism, Reviews, Reprints, *Artificial superlattices, Multilayers.

Intense interest has been generated over the past several years in the growth and properties of layered magnetic materials, both from a fundamental point of view and for applications. For the purposes of this review, the term artificial metallic superlattice will be reserved for true three dimensionally coherent layered structures, while the term multilayer will be used for layered structures in which coherence is present in less than three dimensions. The recent refinements in computer-controlled molecular beam epitaxy (MBE) techniques for the growth of single crystal artificial superlattices of two or more distinct compositions have opened up vast possibilities for the production of tailor-made artificial superlattices with controlled film thicknesses down to atomic dimensions and with highly reproducible stacking sequences. This has provided previously unavailable opportunities to examine problems of interaction ranges, tunneling distances, and other coherent phenomena which are dependent on the superlattice periodicity. In particular, the development starting in 1984 of MBE growth procedures for single crystal rare earth metal superlattices has permitted prototypical tests for verifying many of the theoretical concepts of magnetic exchange, anisotropy, and magnetostriction effects in the rare earths which could not previously be examined in as controlled a way using conventional bulk materials.

Keywords: *Electronic structure, *Photoemission, Heusler alloys, Magnetic alloys, Valence bands, Band theory, Binding energy, Reprints, *Nickel manganese antimonides, Density of states.

Photoemission was used to investigate the electronic density of states (DOS) in Ni2MnSb and NiMnSb. Comparisons with calculated band structures reveal reasonable agreement, but there are indications that the calculations overemphasize Ni 3d contributions at some binding energies. Resonant effects at the Mn 3p core threshold were employed to obtain information on the Mn 3d partial densities of states and these indicate that Mn 3d character is spread throughout the valence bands, in agreement with theory. These effects are strongest in the bottom of the valence band around a binding energy of 3.1 eV and produce structure which agrees well with the theoretical Mn 3d DOS, but are weak for other portions of the calculated Mn DOS. These results are discussed in the context of models for the formation of localized moments in these materials.

Keywords: *High temperature superconductor, *Superconducting films, *YBCO superconductors, Scanning tunneling microscopy, Electron diffraction, Crystal growth, Laser ablation, Thin films, Morphology, Reprints, *Yttrium barium cuprates, Surface structure.

Using scanning tunneling microscopy (STM) and reflection high energy electron diffraction (RHEED) we have examined the growth morphology, surface structure, and surface degradation of laser ablated YBa2Cu30(7-delta) thin films. Films from 5 nm to I micrometer thick were studied. The films were deposited on MgO and LaAlO3 substrates using two different excimer laser ablation systems. Both island nucleated and spiral growth morphologies were observed depending on the substrate material and deposition rate used. The initial growth mechanism observed for a 5-10 nm thick film is replicated through different growth layers up to thicknesses of 200 nm. Beyond 200 nm, the films show some a-axis grains and other outgrowths. The thinnest films (5-10 nm) show considerable surface roughness on the order of 3-4 nm. For both growth mechanisms the ledge width remains approximately constant (about 30 nm) and the surface roughness increases as the film thickness increases.

Keywords: *Superconductors, *Films, *Magnetism, Microstructure, Creep rate, Flux(Rate), Current density, Transport properties, Data processing, Magnetic hysteresis, Reprints, Flux creep.

Transport data, magnetic hysteresis and flux creep activation energy experimental results are presented for silver-sheathed high-Tc Bi2Sr2Ca2Cu3Ox superconducting tapes. The 110 K superconducting phase was formed by lead doping in a Bi-Sr-Ca-Cu-O system. The transport critical current density was measured at 4.0 K to be 0.7 x 10(5) A/sq. cm (the corresponding critical current is 74 A) at zero field and 1.6 x 10(4) A/sq. cm at 12 T for H(double vertical bars)ab. Excellent grain alignment in the a-b plane was achieved by a short-melting method, which considerably improved the critical current density and irreversibility line.

Composites of dissimilar materials wherein the sizes of the constituents are on the order of a few nanometers (Nanocomposites) are found to possess properties similar to, but different from, the properties of the individual constituents. When at least one of the constituents possesses a permanent magnetic moment, the magnetization statics and dynamics of the nanocomposite can be very different from that of the magnetic species in bulk form. In addition, the sensitivity of these magnetic properties to composition and morphology allows the class of magnetic nanocomposites to serve as a laboratory for the atomic engineering of materials with specific magnetic characteristics.

R. D. Shull, L. J. Swartzendruber, and L. H. Bennett. 1991, 15p.
Pub. in Proceedings of International Cryocoolers Conference (6th), Plymouth, MA., October 25-26, 1990, p231-245 1991.

Keywords: *Superconductors, *Magnetic properties, Microstructure, Magnetic field, Barium, Yttrium, Copper oxides, Currents, Vortices, Reprints, Twins, BaYCuO, Vortex pinning, Critical currents, Magnetocaloric effect.

The magnetic properties of nanocomposites containing extremely small magnetic particulates dispersed in a nonmagnetic matrix can be very different than those of the bulk magnetic material. Here we consider the consequences of such a microstructure on the magnetocaloric effect. Upon the application of an external magnetic field, the magnetic spins in a material tend to align with the field, thereby reducing the magnetic entropy of the spin system. Creation of a nanocomposite with many very small ferromagnetic regions provides an effective enhanced magnetic moment which can result in certain temperature and field ranges in an increased dT over that provided by either paramagnetic or ferromagnetic materials, with potential application to magnetic refrigeration.

1993, 10p.
Pub. in Polymer Jnl. 25, n3 p291-300 1993.

Keywords: *Thin films, *Polystyrene, *Neutron reactions, Electron microscopy, Neutron scattering, Polymers, Gyration, X rays, Reprints, TEM(Transmission electron microscopy), Water casting method, Tagged-polymer method, Radius of gyration.

The preparation condition of polystyrene (PS) ultra thin film by a water casting method was investigated on the basis of transmission electron microscopic (TEM) observations. Homogeneous ultra thin films were prepared from a 0.2-2.0 wt% cyclohexanone solution of PS owing to moderate spreadability of the solution on the water surface. The spreading state of the solution on the water surface depending on the dissipation speed of solvent and entanglements among PS chains were in strong relation to formation of the homogeneous ultra thin film. X-Ray interference measurements revealed that the thickness of the ultra thin film was smaller than the dimension of an unperturbed PS chain.

Pub. in Nuclear Instruments and Methods in Physics Research B 56-7, p304-308 May 91.

Keywords: *Anisotropy, *Polarization, *X rays, Atoms, Molecules, X ray analysis, Reprints, X ray emission.

Strongly anisotropic, polarized Cl Kbeta x-ray emission has been observed from gas-phase CF3Cl following selective resonant excitation with a linearly polarized x-ray beam. Distinctively different polarizations and angular distributions result for emission involving molecular orbitals of different symmetries. A classical model of the x-ray absorption/emission process well describes the observed radiation patterns. A small anisotropy also was measured for Ar Kalpha emission following resonant excitation. The observation of only a small anisotropy in this case is attributed to the averaging out of the individual anisotropies from unresolved final states. The authors review the experimental methods and results and discuss theoretical models used to describe polarization and anisotropy effects in x-ray absorption and emission from atoms and molecules.

Elastic Properties of Central-Force Networks with Bond-Length Mismatch.
Final rept.
M. F. Thorpe, and E. J. Garboczi. 1990, 13p.
Pub. in Physical Review B 42, n13 p8405-8417 1990.

Keywords: *Elastic properties, *Crystal lattices, *Crystal defects, Crystal structures, Bonding, Crystallography, Strain rate, Stress analysis, Reprints, *Bond-length mismatch.

We study a triangular network containing two kinds of Hooke springs with different natural lengths. If the two spring constants are the same, we can solve the model exactly and show that Vegard's law is obeyed, irrespective of whether the bonds are arranged randomly or in a correlated way. A more complete description of these networks is obtained through the mean lengths and length fluctuations associated with the two kinds of bonds, and the strain energy. The complete distribution of bond lengths is obtained numerically and shows an interesting and unexpected symmetry for the random case. Finally, we show that numerical results for a similar system, but with different force constants as well as different natural lengths, can be well accounted for by using an effective medium theory which reduces to the exact results when the two spring constants are made equal. We show that these lattices can be described very accurately up to about 50% length mismatches, when pleating occurs and the lattices develop local instabilities.

Determination of Thermoactivation Parameters of Vortex Mobility in YBa2Cu3O7 Using Only Magnetic Measurements.
Final rept.
M. J. Turchinskaya, A. L. Roytburd, L. H. Bennett, L. J. Swartzendruber, and K. Sawano. 1991, 10p.
Pub. in Physica C 182, n4-6 p297-306 1991.

Keywords: *High temperature superconductors, *YBCO superconductors, Type 2 superconductors, Magnetic measurement, Magnetic induction, Activation energy, Time dependence, Single crystals, Reprints, *Yttrium barium cuprates, Vortex mobility.

A method for determination of the basic parameters of vortex mobility from the magnetic induction vs. time curve obtained from a zero-field cooled superconductor is presented. Three stages of magnetizing are considered. Measurement of the log-creep rate allows determination of the activation moment alpha, while the study of the kinetics during the approach to equilibrium provides the relaxation time r, and the equilibrium inductions B(o). Then the activation energy U can be calculated. These two stages were obtained both for three different samples of YBa2Cu3O7: a single crystal, a sintered powder, and a sample prepared by the quench-melt-growth (QMG) process. The QMG sample was perfect enough to give reliable quantitative results.

Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Magnetism and Structure in Systems of Reduced Dimension, p101-112 1993.

Keywords: *Exchange interactions, *Magnetism, Scanning electron microscopy, Whiskers(Single crystals), Fermi surfaces, Metal films, Polarization, Epitaxy, Iron, Chromium, Silver, Spacers, Reprints, Oscillatory coupling, Multilayers.

We have used scanning electron microscopy with polarization analysis (SEMPA) to investigate the magnetic exchange coupling between an Fe film and an Fe whisker separated by either a Cr or Ag spacer layer. The thickness dependence of the oscillatory coupling in these atomically well ordered, epitaxial films was precisely measured. The periodicity of exchange coupling is consistent with predictions based on Fermi surface spanning vectors of the interlayer material.

Pub. in Jnl. of Applied Physics 69, n8 p4501-4504 1991.

Keywords: *Magnetic recording, Remanent magnetism, Coercive force, Experimentation, Verification, Particulates, Reprints, *Preisach model, Angular dependence, Micromagnetics.

A vector moving Preisach model has been developed that describes partially oriented particulate media by pseudo-particles, consisting of a distribution of several basic particles with various orientations of easy axes. The model uses switching modes calculated by a micro-magnetic simulation of physical particles. In order to test this model, the angular dependence of the magnetic properties was measured by a VSM for several samples of commercial recording media that had different degrees of particle orientation. The experimental results are in good agreement with the orientation dependence of the squareness, remanence, and coercivity, as predicted by the model.

Keywords: *High temperature superconductors, *Tunnel junctions, Electron tunneling, Temperature dependence, BSCCO superconductors, YBCO superconductors, Energy gap, Electrodes, Niobium, Cuprates, Reprints, Tunneling spectroscopy.

Tunneling spectroscopy measurements were performed on squeezable electron tunneling (SET) junctions using Bi-Sr-Ca-Cu-O, Y-Ba-Cu-O, and Nb electrodes in a variety of combinations. A zero-bias conductance peak has been seen repeatedly in the current-voltage (I(V)) and the conductance-voltage (G(V)) characteristics. A model is presented to explain this conductance peak in terms of quasi-particle tunneling, phase diffusion, and a supercurrent. Two additional structures have been seen repeatedly in I(V) and G(B). One of these structures has the characteristics of an energy gap feature. The other structure, which can mimic the gap feature, is explained in terms of the switching to the voltage state of a grain boundary junction that is in series with the SET junction. The dependence of these features upon temperature and the force applied to the junction are examined.

T. Walsh, J. Moreland, R. H. Ono, and T. S. Kalkur. 1991, 4p.
Pub. in Physical Review Letters 66, n4 p516-519 1991.

Keywords: *High temperature superconductors, *Superconducting junctions, *Superconducting films, *BSCCO superconductors, *Energy gap, Temperature range 0000-0013 K, Quasi particles, Electron tunneling, Thin films, Reprints, *Bismuth strontium calcium cuprates.

We have used squeezable electron tunneling junctions, at 4 K, to examine the zero-bias conductance peak that has been found in high temperature superconductor tunnel junction spectra by a number of researchers. In addition, peaks in the differential conductance-voltage characteristic have been found repeatedly between 46 and 64 mV. We interpret the voltages at which these peaks occur to be the gap voltage 2 delta (4 K). The zero-bias conductance peak can be explained in terms of a supercurrent and thermal excitations, both quasi-particles and phase diffusion.

Analytic Calculation of Polarized Neutron Reflectivity from Superconductors.
Final rept.
H. Zhang, and J. W. Lynn. 1993, 12p.
Pub. in Physical Review B 48, n21 p15 893-15 904, 1 Dec 93.

Keywords: *Superconducting films, *Superconductors, Polarized beams, Penetration depth, Angle of incidence, Schrodinger equation, Magnetic fields, Thick films, Meissner effect, Ferromagnetic materials, Magnetization, Reprints, *Neutron reflection, *Polarized neutron reflectometry.

We have obtained an analytic expression for the reflectivity R(sup + -)(theta, lambda) of polarized neutrons from a superconductor in the Meissner state, where lambda is the magnetic-field penetration depth and theta is the incident angle of the neutron beam. The result is derived as an exact solution of the 1D Schroedinger equation in the continuum limit, with an interaction potential. The solution for R(sup + -)(theta, lambda) reveals surprising features in its lambda dependence that have not been discovered in previous numerical studies. In particular, R(sup -)(theta, lambda) displays an oscillatory dependence on lambda within a narrow angular range immediately above the total reflection angle, instead of a monotonic dependence as inferred from earlier numerical calculations. The solution also reveals that complete transmission for the down-spin state (R(sup -)(theta, lambda) = 0) may occur when lambda and H (the applied magnetic field) satisfy certain conditions.

Dislocation Emission at Ledges on Cracks.
Final rept.
S. J. Zhou, and R. Thomson. 1991, 15p.
Pub. in Jnl. of Materials Research 6, n3 p639-653 1991.

Keywords: *Dislocations, *Emission, *Crack tips, *Ledges, Brittleness, Fracture(Mechanics), Cracking(Fracturing), Crack initiation, Solid mechanics, Reprints.

In this paper, we propose that, depending on their height, ledges on cracks can be efficient sources of dislocations at loadings well below the critical loading for homogeneous emission. Detailed three dimensional elastic calculations are presented supporting this proposition. There are two configurations for emission; one which blunts the crack, and one we call a jogging configuration. By our calculations, the blunting configuration should be the more efficient source; however, jogging dislocations are more frequently observed, experimentally. We find that the ledge is only a finite source of dislocations, in the sense that the ledge height decreases as the dislocations are emitted. The atomic configuration at the ledge is composed of finite lengths of real dislocations, which is the reason why such dislocations can be emitted easier than homogeneously produced dislocations. The stresses at the ledge tip produce a cloud of bound dislocations near the ledge, pinned at the ledge ends, so that the ledge crack configuration becomes delocalized. Delocalization of the pile-up dislocations in the jogging direction may explain why the jogging dislocations are more frequently seen. Implications for DFZ's and ductile transitions are discussed.

Shielding of Cracks in a Plastically Polarizable Material.
Final rept.
S. J. Zhou, and R. Thomson. 1991, 10p.
Pub. in Jnl. of Materials Research 6, n8 p1763-1772 1991.

Keywords: *Shielding, *Crack tips, *Fracture strength, *Dislocations, Plastic properties, Mechanical properties, Polarization(Waves), Dipoles, Emission, Brittleness, Reprints, *Plastically polarizable materials.

In this paper, we address some fundamental questions regarding the response of a crack to externally generated dislocations. We note that since dislocations formed at external sources in the material must be in the form of loops or dipoles, that the theory must be couched in terms of crack shielding in a plastically polarizable medium. There are strong analogies to dielectric theory. We prove two general theorems: (1) Dipoles formed in the emission geometry relative to a crack tip always antishield the crack, and (2) when dipoles are induced during uniform motion through a uniformly plastically polarizable material, then the shielding is always positive. We illustrate these general theorems with a number of special cases for fixed and polarizable sources. Finally, we simulate the self consistent time dependent response of a crack to a polarizable source as the crack moves past it. The results show the crack is initially antishielded, but that positive shielding always dominates during later stages of configuration evolution. The crack may be arrested by the source, or it may break away from it, depending upon the various parameters--source strength and geometry, dislocation mobility, Griffith condition for the crack, etc. The results indicate that the time dependence of crack shielding in the presence of a nonuniform density of sources will be very important in practical cases of brittle transitions in materials.

Lattice Position of Si in GaAs Determined by X-Ray Standing Wave Measurements.
Final rept.
A. Shih, P. Cowan, S. Southworth, B. Karlin, F. Moore, E. Dobisz, H. Dietrich, L. Fotiadas, and C. Hor. 1993, 8p.
Pub. in Jnl. of Applied Physics 73, n12 p8161-8168, 15 Jun 93.

Keywords: *Gallium arsenides, *Silicon additions, Molecular beam epitaxy, Synchrotron radiation, Ion implantation, Thermal diffusion, Standing waves, Position finding, Crystal lattices, X-ray analysis, Doped crystals, Impurities, NSLS, Reprints, *Lattice sites.

The x-ray standing wave (XSW) technique was applied to determine the lattice location of Si impurity atoms in GaAs(100) crystals. The synchrotron radiation of X24A at the national synchrotron light source was used to set up backreflection XSW, an experimental geometry which drastically relaxes the otherwise stringent requirement on the lattice perfection. Specifically, the lattice sites were determined with respect to the (left bracket) 311 (right bracket) reflection planes which differentiate a Ga site from an As site. With the aid of an appropriate choice of the x-ray fluorescence filter, we were able to study GaAs(100) samples with very low levels of Si impurities. On a sample doped with 4 X 10(exp 18)/cc Si during the molecular-beam epitaxy growth, we found that the Si atoms predominantly occupied the Ga sites. On both an ion-implanted sample after annealing and a sample with Si impurities introduced by thermal diffusion, about 30% of the Si atoms occupied the Ga sites, and the rest occupied random sites. The As site occupation was less than 6%. Suggestions are made for further experiments with improved sensitivity.

Field Dependence of the Magnetic Ordering of Cu in R2CuO4 (R = Nd, Sm).
Final rept.
S. Skanthakumar, J. W. Lynn, J. L. Peng, and Z. Y. Li. 1993, 3p.
Pub. in Jnl. of Applied Physics 73, n10 p6326-6328, 15 May 93.

Keywords: Neutron diffraction, Electron spin, Spin orientation, Copper, Reprints, *Neodymium cuprates, *Samarium cuprates, *Magnetic ordering, Magnetic field dependence.

We have used neutron diffraction techniques to study the field dependence of the magnetic ordering of Cu spins in R2CuO4 (R=Nd,Sm) in order to distinguish between the proposed collinear and noncollinear spin structures. In the proposed collinear spin structure, there are two separate domains with the spins either along the (110) or along the (1-10) directions, while in the noncollinear model there is a single domain with the alternate-layer spins along the (100) and (010) directions, respectively. If a magnetic field is applied along the (1-10), strong hysteresis effects are anticipated for the collinear spin structure due to domain repopulation, while such effects are not expected for the noncollinear spin structure. Our field dependent data do not show any hysteresis effects associated with the pure Cu ordering, which strongly suggest that the noncollinear spin structure is correct for the magnetic spin configuration of the Cu spins of both compounds. Hysteresis effects in a field are observed in Sm2CuO4 near and below the Sm ordering temperature, and these are most likely caused by the interaction between Sm and Cu sublattices.

Keywords: Spin orientation, Neutron diffraction, Electron spin, Copper, Reprints, *Neodymium cuprates, *Samarium cuprates, Magnetic field dependence, Magnetic ordering.

Field-dependent neutron-diffraction measurements have been taken on Nd2CuO4 and Sm2CuO4 in order to distinguish between the proposed collinear and noncollinear spin structures for the Cu ions. For magnetic fields applied along the (110) direction, both systems exhibit Bragg intensities that are continuous and reversible with H. For Nd2CuO4 we have also taken data for fields applied within an angle alpha of the (100) direction, and we have found that the intensities of the magnetic reflections increase or decrease depending on the sign of alpha. Both of these observations are only consistent with the noncollinear spin model.

Pub. in Jnl. of Vacuum Science and Technology A 11, n4 p1361-1366 Jul/Aug 93.

Keywords: *Superconducting films, *Magnesium oxides, *Surface analysis, High temperature superconductors, Substrates, Thin films, Microstructure, Annealing, Impurities, Calcium, Reprints, *Dysprosium barium cuprates.

This article reports results from a study on the effect bulk impurities in MgO substrates may have when substrates are annealed to improve film microstructure and transport properties. DyBaCuO thin films are prepared by molecular beam reactive coevaporation on

both annealed and unannealed MgO(100). While predeposition annealing has led to improved film quality for some groups, under our conditions just the opposite occurs. We point out the existence of Ca segregation to the MgO surface as a factor that needs investigation because Ca is a common contaminant in commercially supplied MgO. Atomic force microscope images show decoration of annealed substrates with submicron size particles that may be composed of the segregated Ca. These particles seem to underlie the distinct differences seen in the surface microstructure of films on annealed and unannealed substrates.

Pub. in Jnl. of Electronic Materials 23, n2 p195-200 1994.

Keywords: *Indium phosphides, *Vapor phase epitaxy, Atomic force microscopy, Optical microscopy, Surface roughness, Orientation(Direction), Light scattering, Laser radiation, Substrates, Reprints, In situ monitoring, Surface topography.

Surface morphology of InP layers is monitored during organometallic vapor phase epitaxy using an in situ diffuse laser light scattering technique. Changes in the diffuse scatter signal are noted for several substrate orientations near the (001) plane and at various growth temperatures. The diffuse scatter signal is shown to be a semi-quantitative indicator of surface roughness through post-growth examination of the samples with phase contrast optical microscopy and atomic force microscopy. Singular substrates consistently have almost featureless surfaces and very little diffuse scattering during growth. Vicinal substrates display a more complicated morphological evolution which cannot be deduced from the diffuse scattering alone but which does produce characteristic changes in diffuse scattering.

Keywords: *Josephson junctions, Josephson effect, Cooper pairs, Superconductivity, Reprints, *Single electron transistors, Coulomb blockage, Supercurrent, Nanoelectronics, Shapiro steps.

Measurements of two ultrasmall Josephson junctions connected in series show a supercurrent with magnitude much greater than previously reported for similar devices. The dependence of the supercurrent on gate charge shows agreement with predictions made by Averin and Likharev that are based on a conjugate relationship between the junction phase and charge variables. The transport of Cooper pairs through the two junctions makes the devices behave effectively as a single junction whose critical current is modulated by the gate charge.

Pub. in Magnetic Susceptibility of Superconductors and Other Spin Systems, p49-80 1991.

Keywords: *Magnetic susceptibility, *Superconductors, Superconducting films, Alternating current, Granular materials, Critical field, Critical current, Meissner effect, Demagnetization, Thin films, Sensitivity, Operation, Calibration, Design, Reviews, Reprints, Susceptometers.

This review critically analyzes current practice in the design, calibration, sensitivity determination, and operation of alternating-field susceptometers, and examines applications in magnetic susceptibility measurements of superconductors. Critical parameters of the intrinsic and coupling components of granular superconductors may be deduced from magnetic susceptibility measurements. The onset of intrinsic diamagnetism corresponds to the initial decrease in electrical resistivity upon cooling, but the onset of intergranular coupling coincides with the temperature for zero resistivity. The lower critical field may be determined by the field at which the imaginary part of susceptibility increases from zero. Unusual features in the susceptibility of superconductor films, such as a magnetic moment that is independent of film thickness and the variation of susceptibility with angle, are related to demagnetization.

Keywords: *High temperature superconductors, *Superconducting films, *YBCO superconductors, *Electric contacts, *Contact resistance, Soldered joints, Critical current, Electrical resistance, Thin films, Indium, Silver, Reprints, *Yttrium barium cuprates, *Pressure contacts.

High current, low resistance, nonmagnetic, and nondestructive pressure contacts to Ag pads on YBa2Cu3O(7-delta) (YBCO) thin film superconductors were developed in this study. The contact resistance reported here includes the resistance of the current lead/Ag pad interface, the Ag pad/YBCO interface, and the bulk resistance of the contact material. This total contact resistance is the relevant parameter which determines power dissipation during critical-current measurements. It was found that regardless of the optimization of the Ag pad/YBCO interface through annealing, a pressure contact can yield a lower total resistance than a soldered contact. The lowest resistance obtained with pressure contacts was 3 (micro)ohms (for a 2 X 4 sq mm contact). These contacts may be useful for many different high temperature superconductor (HTS) studies where high-current contacts with low heating are needed.

Phase-pure thin films of the YBa2Cu3O(7-x) (YBCO) lattice matched and low loss tangent perovskite insulator PrGaO3 have been grown in situ on single-crystal (110) LaAlO3 substrates by metalorganic chemical vapor deposition (MOCVD). Films were grown at temperatures of 750-800 C using beta-diketonate precursors M(dpm)3 (M = Pr,Ga; dpm = dipivaloylmethanate). YBCO films were then grown on the MOCVD-derived PrGaO3 by pulsed laser deposition (PLD). Scanning electron microscopy reveals that the PrGaO3 films have smooth, featureless surfaces. As assessed by x-ray diffraction, the PrGaO3 films grow epitaxially on LaAlO3 with a high degree of (001) and/or (110) plane orientation parallel to the substrate surface, and the subsequent YBCO films grow with a (00l) orientation. Rocking curve and phi-scan analyses reveal that the PrGaO3 and YBCO films grow epitaxially. YBCO films grown by PLD on the MOCVD-derived PrGaO3 exhibit T(c) = 91 K and J(c) = 6 X 10(exp 6) A/sq cm at 77 K in zero field.

Relationship between Bulk-Modulus Temperature Dependence and Thermal Expansivity.
Final rept.
H. Ledbetter. 1994, 5p.
Pub. in Physica Status Solidi (b) 181, p81-85 1994.

Keywords: *Bulk modulus, *Thermal expansion, Zero point energy, Temperature dependence, Debye temperature, Gruneisen constant, Elastic properties, Metals, Reprints.

The relationship between two anharmonic physical properties is considered: the bulk-modulus temperature dependence and the thermal expansivity. For the first, Varshni's relationship is used, which derives from an Einstein-oscillator model of crystals. For the second, a relationship from Slater is used with a similar basis. The ration of the two properties is found to be gamma + 1, where gamma denotes the usual Gruneisen parameter. Varshni's adjustable parameter s is interpreted in terms of the Gruneisen parameter, the Einstein temperature, and the atomic volume. Applied to metals, our relationship works well for those with s-p-electron bonding, but poorly for those where d-electrons contribute to bonding.

Using ultrasonic methods, we studied the 4-295 K elastic constants of a 'good' Y1Ba2Cu3O7 polycrystal. We report the bulk, shear, Young moduli and the Poisson ratio. Except for the Poisson ratio, all elastic constants show smooth temperature behavior. Near T(c) during cooling, the Poisson ratio decreases irregularly. Focusing on the bulk modulus B, we use simple thermodynamics to show that the harmonic-observed decrement at T = O corresponds to expectation, but the temperature effect dB/dT is too large by about a factor of two. We attribute the irregular slope to oxygen-atom reordering. Against many reports, our bulk-modulus value is approximately that found in monocrystals or that predicted by an ionic-crystal model calculation.

Microwave transmission and reflection measurements are performed simultaneously on thin films (approx 1,800 A) of YBa2Cu3O(7-x) having their c axis per-

pendicular to the LaAlO3 substrate. We determine power transmission and reflection fractions, Tau(T,H) and R(T,H), as functions of temperature and static magnetic field (O < H < 5.4 T), the latter being applied perpendicular to the film. A guided-wave model, which we develop for our experimental situation, is the basis of a computational algorithm that extracts quantitative values of the complex penetration depth (lambda bar), or alternatively the complex surface impedance Z(s), from Tau and R data. This inversion algorithm is successful when applied to test data generated from a phenomenological theory describing the electrodynamic response of a type-II superconductor. The procedure is applied to Tau(T,H) and R(T,H) measurements to infer the temperature- and field-dependent complex penetration depth (lambda bar)(T,H) that completely characterizes the superconductive film's electromagnetic response.

We propose a novel hot-electron microcalorimeter for measurements of x-rays or phonons produced by the interaction of a high energy particle with the underlying substrate. This type of detector uses a normal metal film to absorb the incoming excitation which subsequently heats the electrons above the lattice temperature. The temperature of the electrons is measured from the current - voltage characteristics of a superconductor-insulator-normal metal tunnel junction, where part of the absorber forms the normal electrode. We present simple calculations of the energy sensitivity of the junction and of the ultimate performance of x-ray and phonon detectors. We also present preliminary measurements of prototype devices which were used to test the basic detector physics.

Proposed Antiferromagnetically Coupled Dual-Layer Magnetic Force Microscope Tips.
Final rept.
J. O. Oti, P. Rice, and S. Russek. 1994, 3p.
Pub. in Jnl. of Applied Physics 75, n10 p6881-6883, 15 May 94.

Keywords: Magnetic films, Exchange interactions, Antiferromagnetism, Magnetostatics, Resolution, Reprints, *Magnetic force microscopy, *Microscope tips, Dual layers, Micromagnetics.

A magnetic force microscope tip designed from dual-layer magnetic films of antiferromagnetically coupled magnetic layers is proposed. A theoretical analysis of the possible advantages of such a tip over conventional single-layer tips is given, using an extension to dual layers of a previously described micromagnetic model of single-layer tips. In contrast to single-layer tips, the magnetic domains of dual-layer tips are less sensitive to the fringing fields of the specimen, and the tips' stray fields are greatly reduced, thus minimizing the likelihood of erasure of the sample magnetization. These properties of dual-layer tips should lead to improved resolution of magnetic force microscopy images.

Magnetic and Magnetoresistive Properties of Inhomogeneous Magnetic Dual-Layer Films.
Final rept.
J. O. Oti, S. E. Russek, and S. C. Sanders. 1994, 3p.
Pub. in Jnl. of Applied Physics 75, n10 p6519-6521, 15 May 94.

Keywords: *Magnetoresistance, *Magnetic films, Magnetic anisotropy, Coercive force, Exchange interactions, Cobalt alloys, Nickel alloys, Metal films, Magnetostatics, Chromium, Simulation, Reprints, Dual layers, Micromagnetics, Multilayers.

Magnetic and magnetoresistive properties of sputtered Co alloy dual-layer films are compared with micromagnetic simulations. The simulations elucidate the details of the switching behavior of the dual-layer films as a function of the interlayer exchange and magnetostatic interactions. The simulations have led to a conceptual understanding of the coercive field splitting caused by the interlayer interactions. A calculation of the anisotropic magnetoresistance (AMR) has been included in the simulations. The AMR provides a second independent macroscopic quantity (in addition to the average magnetization) which can be measured and compared with the micromagnetic simulations. The AMR is more sensitive to the micromagnetic structure perpendicular to the applied field and is a better test of the accuracy of the micromagnetic model. The simulations qualitatively describe the measured AMR data on CoNi-Cr-CoNi dual layers.

Enhanced Flux Pinning via Chemical Substitution in Bulk Superconducting T1-2212.
Final rept.
M. Paranthaman, M. Foldeaki, D. Balzar, A. M. Hermann, H. Ledbetter, and A. J. Nelson. 1994, 7p.
Pub. in Supercond. Sci. Technol. 7, p227-233 1994.

Keywords: *Flux pinning, High temperature superconductors, Temperature range 0000-0013 K, Penetration depth, Magnetic hysteresis, Magnesium additions, Direct current, Doped materials, Critical current, Crystal defects, Reprints, *Thallium barium calcium cuprates.

The flux-pinning characteristics in both pure and doped superconducting Tl2Ba2CaCu2O8 (referred to as Tl-2212) systems were studied via DC magnetic hysteresis as well as flux-penetration and flux-expulsion measurements. Our results demonstrate an increase in both intrinsic pinning and lock-in transition of flux lines as a result of increased density of atomic-size structural defects via Mg doping in Tl-2212.

Pub. in Applied Physics Letters 65, n17 p2232-2234, 24 Oct 94.

Keywords: *YBCO superconductors, *Electron tunneling, High temperature superconductors, Superconducting films, Electrical resistivity, Boundary layer, Thin films, Interfaces, Silver, Reprints, *Yttrium barium cuprates, Contact resistivity.

We have measured interface transport in thin-film YBa2Cu3O(7-delta)/Ag interfaces having resistivities ranging from 10(exp -8) to 10(exp -3) ohm sq cm. Analysis of the interface I-V data indicates that tunneling is the predominant transport mechanism even for the in situ interfaces having contact resistivities of 1-7 X 10(exp -8) ohm sq cm. Zero-bias conductance peaks are also observed for the entire range of interface resistivity. The similarity of the zero-bias conductance peaks among these widely varying interfaces suggests that the low-temperature interface transport is governed by the same mechanism in each case. These conductance peaks are analyzed in the framework of the Appelbaum-Anderson model for tunneling assisted by magnetic scattering from isolated magnetic spins in the interface.

Keywords: *High temperature superconductors, *Gamma ray astronomy, *Meetings, High-Tc superconductors, Electron tunneling, Radio galaxies, Radio sources(Astronomy), Gamma ray observatory, Cosmic rays, Quasars, Cuprates, *Ginzburg symposium.

A one day symposium honoring Professor Vitaly L. Ginzburg and his many contributions to the world of physics was held at the National Institute of Standards and Technology. An additional purpose was to explore future directions for research in the context of his extensive involvement in the rapid developments in physics in the last fifty years. This transcription of the proceedings includes invited talks on some of those recent developments in such fields as superconductivity and astrophysics. Prof. Ginzburg's own address 'What problems of physics and astrophysics seem now to be especially important and interesting' was the focus for discussion on the future directions of physics research. Titles of the other papers given at the symposium are as follows: New Phenomena in Proximity Effect Tunneling in High TC Superconductors; Radio Galaxies, Quasars, and Superluminal Radio Sources; Exotic Properties of High TC Materials and the Ginzburg Parameter; Gamma Ray Astrophysics and Early Results of the Compton Observatory; Some Puzzles of the Normal State of High TC Oxides; Galactic Annihilation Radiation.

Keywords: *Josephson junctions, *Thermal noise, High temperature superconductors, YBCO superconductors, Reprints, Yttrium barium cuprates, RSJ model.

We have fabricated YBa2Cu3O(7-delta)-normal metal-YBa2Cu3O(7-delta) step-edge Josephson junctions that fit the resistively shunted junction model with Johnson-Nyquist thermal noise. The I-V curves are well fit over a large temperature range for junctions of varying critical current values. There is good agreement between the fitted thermal noise temperature and the measured ambient temperature. This is strong evidence that these junctions are not dominated by superconducting shorts longer than the superconducting coherence length.

Thin Film Reaction Kinetics of Niobium/Aluminum Multilayers.
Final rept.
K. R. Coffey, K. Barmak, D. A. Rudman, and S. Foner. 1992, 9p.
Pub. in Jnl. of Applied Physics 72, n4 p1341-1349, 15 Aug 92.

Keywords: *Aluminum alloys, *Niobium alloys, *Phase studies, Transmission electron microscopy, X ray diffraction, Reaction kinetics, Metal films, Thin films, Nucleation, Calorimetry, Superconductors, Reprints, *Niobium aluminides, Multilayers.

Phase formation kinetics in Nb/Al multilayered thin films having overall compositions of 25, 33, 50, and 75 at. % Al have been investigated using scanning calorimetry, x-ray diffraction, and cross-sectional transmission electron microscopy. The first phase to form upon annealing the Nb/Al layered structure of all samples is the NbAl3 intermetallic. Calorimetry clearly identifies the NbAl3 formation to be a two-stage process. The first stage is the formation of a planar layer

by nucleation and growth to coalescence while the second stage is the thickening of the planar layer. The next phase observed in samples of 25 and 33 at. % Al is the A15 superconducting phase, Nb3Al. The Nb3Al growth completes a first reaction stage similar to the NbAl3, but the subsequent thickening reaction stage is not observed without simultaneous Nb2Al growth. The high interface velocities derived from the calorimetry for formation of both NbAl3 and the A15 Nb3Al indicate that atomic transport must be by grain boundary diffusion.

Aspects of a Deformable Superconductor Model for the Vortex Mass.
Final rept.
M. W. Coffey. 1994, 9p.
Pub. in Jnl. of Low Temperature Physics 96, n1/2 p81-89 1994.

Keywords: *Superconductivity, Type 2 superconductors, Mathematical models, Temperature dependence, Critical field, Quasi-particles, Elasticity, Mass, Reprints, Vortex dynamics.

A deformable superconductor model for the vortex mass per unit length mu(sub d) in a type-II superconductor is discussed. A new identity for the inertial vortex mass in this model is presented which holds for an arbitrary quasiparticle fraction when the ionic displacement is irrotational. This result is used to show unphysical behavior in the temperature dependence of the ionic-strain-field vortex mass and is key in resolving this difficulty. A possibility for the experimental observation of the strain field mechanism is discussed.

Deformable Superconductor Model for the Fluxon Mass.
Final rept.
M. W. Coffey. 1994, 4p.
Pub. in Physical Review B 49, p9774-9777, 1 Apr 94.

Keywords: *Superconductivity, Type 2 superconductors, Mathematical models, Quasi-particles, Elasticity, Mass, Reprints, *Fluxons, Vortex dynamics.

Outstanding difficulties in a deformable type-II superconductor model for the fluxon inertial mass per unit length mu(sub d) are resolved. An identity for the inertial mass, valid for an arbitrary quasiparticle fraction when the ionic displacement field is irrotational, plays a critical role in the analysis. This approach avoids previously employed approximations, leading to qualitatively different results, including a fluxon mass which properly vanishes at the transition temperature and which has a greatly reduced magnitude. A framework for the solution of the elasticity equation for an isotropic superconductor is presented and the close relation between mu(sub d) and the ionic strain field is shown.

Pub. in Applied Physics Letters 62, n7 p759-761, 14 Feb 93.

Keywords: *BSCCO superconductors, *Radiation effects, *Ion irradiation, *Flux pinning, *Critical current, Hydrogen ions 1 plus, Helium ions, Argon ions, Single crystals, Crystal defects, High temperature superconductors, Light ions, Heavy ions, Reprints, *Bismuth strontium calcium cuprates, Flux vortices.

We report a significant increase in the pinning energy of vortices in single-crystal Bi2Sr2CaCu2O8 when irradiated with heavy ions such as Ar(1+). This is in contrast with the results of light ion (H(1+), He(1+)) irradiations which give pinning energies comparable with those of unirradiated crystals. The stronger pinning is attributed to defects larger than point defects, e.g., clusters or amorphized regions. As a result of higher pinning energies, critical currents persist at markedly higher temperatures and fields.

The interface between ZnSe thin films and GaAs substrates is characterized by High Resolution Transmission Electron Microscopy and room temperature Spectroscopic Ellipsometry. The films were grown on (001) GaAs by Molecular Beam Epitaxy. A three-phase model is used in the reduction of the ellipsometric data, from which the presence of a transition layer of Ga2Se3, with a thickness of less than 1 nm, is confirmed. These results corroborate the high resolution transmission electron microscopy images obtained from the same samples.

Keywords: *Zinc selenides, Molecular beam epitaxy, Semiconducting films, Dielectric properties, Complex numbers, Refractive index, Energy gap, Thin films, Gallium arsenides, Ellipsometry, Substrates, Reprints.

Spectroscopic ellipsometry was used to determine the real and imaginary parts of the dielectric function of ZnSe thin films grown on (001) GaAs substrates by molecular-beam epitaxy, for energies between 1.5 and 5.0 eV. A sum of harmonic oscillators is used to fit the dielectric function in order to determine the values of the threshold energies at the critical points. The fundamental energy gap was determined to be at 2.68 eV. The E(0) + Delta(0) and E(1) points were found to be equal to 3.126 and 4.75 eV, respectively. Below the fundamental absorption edge, a Sellmeir-type function was used to represent the refractive index. At the critical points, E(0) and E(0) + Delta(0), the fitting was improved by using an explicit function combining the contributions of these two points to the dielectric function.

Pub. in Physical Review B 50, n13 p9409-9418, 1 Oct 94.

Keywords: *Josephson junctions, High temperature superconductors, Alternating current, YBCO superconductors, Grain boundaries, Josephson effect, Parallel orientation, Microwaves, Reprints, Grain boundary junctions, Yttrium barium cuprates.

Half-integral constant voltage steps were observed in many high-T(c) grain-boundary Josephson junctions of YBa2Cu3O(7-delta) when a microwave field was applied. Five distinct observed behaviors of the widths of both integral and half-integral steps as a function of microwave amplitude, Delta I(dc)(I(ac)), are reproduced by simulations of two or three junctions in parallel. This provides quantitative evidence that a single high-T(c) grain-boundary junction is composed of several junctions in parallel. These junctions are formed by the overlap of superconducting filaments on either side of the grain boundary, and the spacing between ones with relatively large critical currents is approximately 20 micrometers.

L. F. Goodrich, A. N. Srivastava, and T. C. Stauffer. 1993, 7p.
Pub. in Cryogenics 33, n12 p1142-1148 1993.

Keywords: *High temperature superconductors, *Electrical measurement, *Critical current, BSCCO superconductors, High-Tc superconductors, Performance evaluation, Design, Reprints, *Standard reference devices.

Obtaining repeatable critical current measurements for a high temperature superconductor (HTS) is a challenging task, as HTSs are highly susceptible to degradation due to mechanical stress, moisture, thermal cycling and aging. This paper discusses the development of a high temperature superconducting standard reference device (SRD) to address these measurement concerns, and gives preliminary data on its characteristics. An SRD is an HTS specimen that has had its critical current /(c) non-destructively evaluated. Because HTSs are sensitive to mechanical alterations, minor changes in sample preparation or mounting procedure could yield large changes in the measured critical current. Preliminary data on SRDs made using Bi-based oxide tapes (2212) with an Ag substrate are presented. Differences between two consecutive measurements of /(c) can typically change by 40%; these deviations have been reduced to about 4%.

Pub. in Physical Review B 48, n2 p1244-1248, 1 Jul 93.

Keywords: *YBCO superconductors, *Niobium stannides, High temperature superconductors, Type 2 superconductors, Temperature dependence, Experimental data, Meissner effect, Magnetic flux, Flux pinning, Magnetization, Diamagnetism, Reprints, *Yttrium barium cuprates.

Experimental aspects of flux expulsion in Nb3Sn and YBa2Cu3O7 type-II superconductors are presented. There is a clear distinction in magnetization between field-cooled measured-upon-cooling (FCC) and field-cooled measured-upon-warming (FCW) results. This thermal hysteresis, predicted in the temperature-dependent critical-state model at low fields by Clem and Hao, was observed for measuring fields up to about 0.5 T. The model explains the observation of increases in diamagnetism after field cooling and thermal cycling. The thermal hysteresis, together with weak links, accounts for the occurrence of a negative peak in FCW magnetization. The FCC-FCW bifurcation observed for a 0.1 mT field down to 5 K might imply that flux lines are not completely frozen below the temperature at which the lower critical field is equal to the measuring field, but are expelled from the sample even in the Meissner state.

Pub. in EMIS Data Reviews, p264-270 1994.

Keywords: *Mercury cadmium tellurides, Shubnikov-de Haas effect, Hall effect, Magnetoresistivity, Reprints.

Magnetotransport techniques are widely used to characterize the electrical properties of HgCdTe. The Hall-effect method is the most common method of determining the carrier density and mobility of semiconductor materials. Multicarrier characterization techniques are needed for determination of carrier densities and mobilities in a multicarrier system present in layered-structures or in a variety of complex semiconductor materials. Because of the importance of these methods for proper electrical characterization of complex HgCdTe single crystals or layered-structures, we discuss this topic pedagogically with the primary objective of promulgation of this emerging tool to the HgCdTe characterization community. We also discuss magnetoresistance and magnetoresistance-based techniques such as the Shubnikov-de Haas effect and magnetophonon effect, which have been used to characterize HgCdTe materials. These techniques are capable of providing very accurate data if applied with care and proper analysis.

1993, 4p.
Contract ONR-N00014-92-F-0003
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Physical Review B 48, n24 p18 316-18 319, 15 Dec 93.

Keywords: Electron tunneling, Thermal noise, Performance, Accuracy, Reprints, *Coulomb blockade, Electron pumps.

We calculate how noise generated by a finite environmental impedance limits the ultimate performance of Coulomb-blockade devices and possible current or charge standards. We have expressed the environmental theory of the Coulomb blockade in terms of the spectral density of the voltage noise arising from the environment, and have calculated the resulting single-junction tunneling, and two-junction cotunneling rates. These rates are used to predict the tunneling rate of electrons through a five-junction pump and may explain the anomalously large rates that are observed experimentally.

Keywords: *Josephson junctions, High temperature superconductors, Superconducting films, Submillimeter waves, Far infrared radiation, YBCO superconductors, Epitaxy, Reprints, Yttrium barium cuprates.

We have fabricated step edge superconductor-normal metal-superconductor microbridges using YBa2Cu3O(7-x) (YBCO) and noble metals with critical current-normal resistance (I(c)R(N)) products as high as 10 mV and normal resistances up to 38 ohms. Our fabrication process achieves high values of the I(c)R(N) product by exploiting the anisotropy in the properties of epitaxial YBCO films, allowing contact only between normal metal and superconductor through the crystalline axes which support the largest Josephson coupling. This results in a dramatic increase in the normal resistance of a junction without decreasing its critical current. We discuss the role of the superconductor-normal metal boundary resistance on the junction electrical properties. We have coupled submillimeter wave rf currents quasioptically into junctions integrated at the feeds of noble metal planar log periodic antennas and have induced up to 7 Shapiro steps in the current-voltage characteristics with a 760 GHz beam from a far infrared laser.

The surface degradation of c-axis oriented YBa2Cu3O(7-delta) thin films due to air, CO2, N2, O2, and vacuum exposure has been studied with reflection high-energy electron diffraction (RHEED), scanning tunneling microscopy, and contact resistivity measurements. The formation of an amorphous surface reaction layer upon exposure to air and CO2 is monitored with RHEED and correlated with an increase in contact resistivity. The contact resistivity of samples exposed to air increases with time. Surfaces exposed to CO2 show a similar degradation while surfaces exposed to N2 showed a slightly different degradation mechanism. Vacuum exposed surfaces show little increase in contact resistivity, indicating no long-term surface oxygen loss.

Pub. in Applied Physics Letters 61, n2 p237-239, 13 Jul 92.

Keywords: *Electrometers, Tunnel junctions, Shot noise, Reprints, *Coulomb blockade electrometers, Single electron tunneling, Quantum noise.

We have measured the noise of a Coulomb blockade electrometer. Below 100 Hz, the noise referred to the input charge has a 1/f power spectrum with a charge noise of 3 X 10(exp -4) e/Hz(sup 1/2) and an energy sensitivity E(N) of 3 X 10(exp 4)(Planck's constant) at 10 Hz. The 1/f noise probably results from the stochastic occupation of charge traps which could in principle be eliminated. The theoretical noise floor is set by shot noise, and indirect measurements show that this contribution to E(N) can be as small as 1.5 (Planck's constant), suggesting that the electrometer will be a quantum limited amplifier if the 1/f noise can be eliminated.

Pub. in Applied Physics Letters 61, n2 p2616-2618, 23 Nov 92.

Keywords: Tunnel junctions, Voltage gain, Electrometers, Reprints, *Single electron transistors, Single electron tunneling, Coulomb blockade.

We report the first observation of voltage gain in the capacitively coupled single-electron transistor (SET). Using parallel-plate and interdigital geometries for the gate capacitor (C(g) = 1.2 and 0.4 fF) and ultrasmall tunnel junctions with capacitances near 0.2 fF, we find maximum voltage gains of 2.8 and 1.5, respectively. The leakage resistance of the gate is of the order 10(exp 12) ohms for the parallel-plate capacitor and greater than 10(exp 18) ohms for the interdigital capacitor.

Increased Transition Temperature in In situ Coevaporated YBa2Cu3O7-delta Thin Films by Low Temperature Post-Annealing.
Final rept.
S. J. Berkowitz, E. De Obaldia, K. F. Ludwig, R. H. Ono, J. A. Beall, L. R. Vale, D. A. Rudman, M. L. O'Malley, L. M. Drabeck, P. A. Polakos, W. J. Skocpol, and P. M. Mankiewich. 1994, 3p.
Pub. in Applied Physics Letters 65, n12 p1587-1589, 19 Sep 94.

Keywords: *YBCO superconductors, *Superconducting films, High-Tc superconductors, Transition temperature, Thin films, Annealing, Strains, Reprints, *Yttrium barium cuprates.

In situ coevaporated YBa2Cu3O(7-delta) thin films have a slightly depressed transition temperature T(c), though they have excellent radio-frequency surface resistance characteristics. These films consistently have less orthorhombic strain than laser ablated or post-annealed films. Low temperature (320-420 C) post-annealing of in situ coevaporated films in 100 kPa of O2 raised T(c) to values as high as 91.5 K with some increase in the orthorhombic strain. All measured thin films show less variation of T(c) with orthorhombic strain than does bulk material.

Crossover in the Pinning Mechanism of Anisotropic Fluxon Cores.
Final rept.
L. D. Cooley, A. Gurevich, and D. C. Larbalestier. 1994, 4p.
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of International Workshop on Critical Currents in Superconductors (7th), Alpbach, Austria, January 24-27, 1994, p573-576.

Keywords: *Flux pinning, *Superconductors, Josephson effect, Crystal defects, Anisotropy, Reprints, Fluxons.

We propose that thin planar defects have a strong magnetic flux-pinning force. Magnetic pinning results from the anisotropic nature of a fluxon when the core is situated in the plane of the defect, and is a consequence of nonlocal Josephson electrodynamics. Since the magnetic pinning force approaches the maximum core-pinning force, a crossover from core pinning to magnetic pinning is predicted when the proximity coupling becomes strong. This model is supported by flux-pinning measurements of an artificial pinning center superconductor.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p3825-3827 Nov 94.

Keywords: *Magnetic devices, *Magnetoresistance, Sizes(Dimensions), Magnetic films, Metal films, Thin films, Magnetization, Cobalt alloys, Iron alloys, Nickel alloys, Copper, Silver, Reprints, Magnetic multilayers.

Giant magnetoresistance (GMR) was measured as a function of device size for patterned NiCoFe/Cu and NiFe/Ag films. For the quasi-granular NiCoFe/Cu films, the normalized maximum change in resistivity (Delta)rho/rho was 8% for most of the samples. For the NiFe/Ag films, antiparallel alignment was achieved through magnetostatic coupling, not exchange fields, with a (Delta)rho/rho of 4.5%. The films were patterned into stripes with Au current leads for size-effect measurements. The height of the stripes varied from 0.5 to 16 micrometers and the track width varied from 1 to 16 micrometers. Discrete switching events and anomalous low-field dips in the response were observed for both materials for small device sizes.

M. N. Deeter, S. Milian Bon, G. W. Day, G. Diercks, and S. Samuelson. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4464-4466 Nov 94.

Keywords: *Ferrite garnets, Yttrium iron garnets, Bismuth additions, Gallium additions, Faraday effect, Frequency response, Response functions, Magneto-optics, Substitutes, Sensitivity, Reprints, *Magnetic field sensors.

We report measurements of the magneto-optic response function and frequency response for three bulk iron garnet crystals grown by a flux technique. The samples were the product of an intensive effort to develop iron garnet compositions with properties specifically optimized for magnetic field sensing. Sensitivity enhancement was achieved through both bismuth substitution (for increasing the saturation Faraday rotation) and gallium substitution (for reducing the saturation magnetization). Frequency response measurements indicate that bismuth substitution actually improves performance (compared to unsubstituted yttrium iron garnet) in contrast with gallium, which causes substantial degradation.

The technique of X-ray photoelectron and Auger electron forward scattering has developed in the past few years into one of the most valuable structural diagnostics for investigating the early stages of epitaxial thin-film growth. A review is given here of this technique with special emphasis on its application to epitaxial films of interest to the thin-film magnetism community. The aim of this review is to provide an easily readable, self-contained account directed primarily at experimentalists, with the hope of making forward scattering accessible to new or occasional users. Some familiarity with XPS and Auger spectroscopy is assumed, as is an elementary knowledge of quantum mechanics.

Keywords: *Magnetic susceptibility, *Superconductors, Temperature dependence, Crystal field, Single crystals, Polycrystals, Magnetic moments, Reprints, *Praseodymium cerium cuprates.

We measured the temperature dependence of the magnetic susceptibility of Pr(2-x)Ce(x)CuO4 monocrystals and polycrystals in the composition range x = 0-0.18. For all compositions, the susceptibility curves reveal strong crystal-field effects and are evaluated in terms of Van Vleck's equation for magnetic susceptibility. At temperatures above 100 K, the behavior could be described by a Curie-Weiss-like equation, the parameters of which allow us to characterize the crystal-field interactions. The concentration dependence of these parameters is much stronger in the monocrystals, with the apparent magnetic moment going through a sharp maximum near x = 0.1, the composition of the onset of superconductivity after a reducing anneal. The concentration dependence of the magnetic moment can be qualitatively interpreted as a contribution of charge-carrying spins in localized states, mainly through initiating Cu(2+)-Pr(3+) interactions. With increasing Ce, these additional spins can not remain localized, thus the magnetic moment decreases, and a reducing anneal results in superconductivity.

M. Green, M. Kurmoo, J. Stalick, and P. Day. 1994, 2p.
Pub. in Jnl. of the Chemical Society, Chemical Communications, p1995-1996 1994.

Keywords: *Crystal structure, Temperature range 0000-0013 K, Temperature range 0013-0065 K, Room temperature, Magnetic susceptibility, Magnetic properties, Neutron diffraction, Reprints, *Copper germanates, Rietveld method.

The crystal structure of CuGeO3, which has been reported to undergo a spin-Peierls transition at 14 K, is

determined by neutron powder diffraction at 300, 20 and 4.2 K and the structure refined in the space group Pmma at all three temperatures, ie without displacement of the Cu atoms from a uniform one-dimensional chain; anisotropic broadening of (h0l) reflections, observed in all three data sets, is successfully modeled by an orthorhombic micro-strain along a and c, i.e. perpendicular to Cu-Cu chains. Below 10 K the magnetic susceptibility fits very well to the Bulaevskii model, indicating a ratio of 0.69 between the Cu-Cu exchange constants in the dimerised chain and a mean exchange constant of 88 K.

Keywords: *Superconductors, Temperature range 0000-0013 K, Phase transformations, Antiferromagnetic materials, Neutron scattering, Oscillations, Reprints, *Holmium nickel boron carbides, *Magnetic ordering.

The nature of the holmium order in the reentrant superconductor (T(c) = 7.5 K) HoNi2B2C is revealed by neutron scattering. Upon cooling, a transversely polarized oscillatory magnetic state is formed (T(M) approx = 8 K), characterized by a wave vector (0,0,Q(c)) where Q(c) approx = 0.05/A is only weakly dependent on temperature and field. At the reentrant superconducting transition (about 5 K), the amplitude of the oscillatory state abruptly decreases in favor of a commensurate antiferromagnet, whereby superconductivity is restored and coexists with antiferromagnetism at low temperatures.

Analytical Expressions for Barkhausen Jump Size Distributions.
Final rept.
F. Y. Hunt, and R. D. McMichael. 1994, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics 30, n6 p4356-4358 Nov 94.

Keywords: *Barkhausen effect, Langevin equation, Markov chains, Random walk, Bessel functions, Reprints.

In previous calculations of Barkhausen jump size distributions, the Langevin equation was used to describe the pinning field h(c). In this paper, h(c) is modeled by discretized random walks which are used to obtain analytical expressions for the Barkhausen jump size distribution, P(tau). For a bounded random walk which reduces to the Langevin function in the continuum limit, P(tau) is a sum of exponentials which is compared to functions of the form P(tau) = tau(sup -alpha)exp(-tau/tau(0)). The scaling exponent changes from alpha approx = 1.5 for small jumps to alpha approx = 1.0 for jumps larger than the correlation length. For an unbounded random walk with exponentially distributed distances between steps in h(c), P(tau) is shown to be proportional to a modified Bessel function which, for long jumps, is asymptotically a pure power law, tau(exp -3/2). This suggests that the scaling exponent shift and the exponential cutoff are caused by correlations in h(c).

Dependence of Tc on Debye Temperature Theta(sub D) for Various Cuprates.
Final rept.
H. Ledbetter. 1994, 2p.
Pub. in Physica C 235-240, p1325-1326 1994.

Keywords: *High-Tc superconductors, *Critical temperature, *Debye temperature, Temperature dependence, Mercury inorganic compounds, YBCO superconductors, BSCCO superconductors, Electron phonon interactions, Reprints, Thallium barium calcium cuprates, Lanthanum cuprates.

The author extends the T(c)-Theta(D) relationship established by Ledbetter and coworkers for La-O and Y-O, and by Dominec for Bi-O, to include Tl-O and Hg-O compounds. In BCS-McMillan materials, Theta(D) occurs both in the pre-exponential factor in the expression T(c) approx = Theta(D) exp (-1/lambda) and in McMillan's expression for the electron-phonon parameter lambda = C/M < omega squared > , where < omega > approx Theta(D). In BCS materials, T(c) increases with decreasing Theta(D), that is with lattice softening. In all five cuprate superconductors listed above, the opposite occurs: T(c) increases with lattice stiffening. From these results, the author draws two principal conclusions. First, T(c) depends on phonons because it depends on Theta(D), the quintessential phonon parameter. Second, the T(c)-Theta(D) relationship for high-T(c) oxide superconductors differs dramatically from that for conventional BCS materials.

Elastic Constants of a Material with Orthorhombic Symmetry: An Alternative Measurement Approach.
Final rept.
M. Lei, H. Ledbetter, and Y. Xie. 1994, 4p.
Pub. in Jnl. of Applied Physics 76, n5 p2738-2741, 1 Sep 94.

Keywords: *Elastic properties, Fiber reinforced composites, Orthorhombic lattices, Ultrasonic radiation, Measurement, Anisotropy, Reprints.

An alternative approach to measuring the complete anisotropic elastic constants C(ij)(S(ij)) of an orthorhombic-symmetry material is proposed. This approach requires measurements along only principal directions: 100. In this approach, a pulse-echo (megahertz-frequency) method was used to measure C(11), C(22), C(33), C(44), C(55), and C(66). A resonance (kilohertz-frequency) method was used to measure three elastic compliances: S(11), S(22), and S(33). Combining the C(ii) with the S(ii), the complete sets of C(ij) and S(ij) were obtained. This approach avoids the troublesome, error-prone determination of off-diagonal C(ij) (S(ij)) by the usual measurements along nonprincipal directions. The approach was applied to a boron-aluminum composite where the off-diagonal terms remain uncertain. In principle, the approach applies to any orthorhombic-symmetry material.

UCu3Al2 crystallizes in an ordered variant of the hexagonal CaCu5 structure. By neutron powder-diffraction, the U atoms were found to occupy the 1a sites, while the 2c sites are occupied by Cu atoms only and a random occupation of the 3g sites by the remaining Cu and Al is found. The magnetic susceptibility, measured on a single crystal grown by the Czochralski tri-arc technique, is found to be maximal within the hexagonal basal plane with a maximum at about 10 K. For fields applied within the basal plane, the magnetization at 4.2 K exhibits a slight S-shape starting slightly below 15 T. No such anomalies are found for fields applied along the c-axis where the magnetic response is found to be much lower. No additional magnetic peaks, which could be related with long-range antiferromagnetic ordering, were detected in the neutron powder-patterns at low temperatures.

Epitaxial Growth and Characterization of the Ordered Vacancy Compound CuIn3Se5 on GaAs (100) Fabricated by Molecular Beam Epitaxy.
Final rept.
A. J. Nelson, M. Bode, G. Horner, K. Sinha, and J. Moreland. 1994, 5p.
Pub. in Materials Research Society Symposia Proceedings, v340 p599-603 1994.

Keywords: *Epitaxial growth, Molecular beam epitaxy, Transmission electron microscopy, Atomic force microscopy, X ray diffraction, Raman spectra, Gallium arsenides, Single crystals, Stacking faults, Energy gap, Photoluminescence, Substrates, Films, Reprints, *Copper indium selenides.

Epitaxial growth of the ordered vacancy compound (OVC) CuIn3Se5 has been achieved on GaAs (100) by molecular beam expitaxy (MBE) from Cu2Se and In2Se3 sources. Electron probe microanalysis and X-ray diffraction have confirmed the composition for the 1-3-5 OVC phase and that the film is single crystal CuIn3Se5 (100). Transmission electron microscopy (TEM) characterization of the material also showed it to be single crystalline. Structural defects in the layer consisted mainly of stacking faults. Photoluminescence (PL) measurements performed at 7.5 K indicate that the bandgap is 1.28 eV. Raman spectra reveal a strong polarized peak at 152/cm, which is believed to arise from the totally symmetric vibration of the Se atoms in the lattice. Atomic force microscopy reveals faceting in a preferred (100) orientation.

We report preliminary results of the high resolution inelastic neutron scattering measurements of the 42.5 meV optical phonon branch in YBCO, whose behavior at momentum transfer q=0 has been extensively studied by Raman scattering. The experiment was done on a large (75g) single crystal of YBa2Cu3O(7-x) (T(c) approx = 90K) with the resolution of 2 meV (full width at half maximum). In cooling from 100K to 50K, we observe a small softening of the phonon energy at q=0.25, 0.25, 0, but no significant linewidth change.

Keywords: *Tantalum sulfides, Temperature range 0065-0273 K, Temperature range 0273-0400 K, Scanning tunneling microscopy, Fourier transformation, Domain structure, Reprints.

Using scanning tunneling microscopy (STM), we studied 1T-TaS2 in all four of its charge-density-wave (CDW) supporting phases over the temperature range 360-143 K. Special attention was given to the search for discommensurate structures and the distinguishing of true CDW discommensurations and domains from apparent discommensurations and domains formed by interference between the CDW and the atomic lattice. In the lowest-temperature commensurate (C) phase, we find that the CDW is in the commensurate configuration as expected. In the nearly commensurate (NC) phase, the CDW is in a true domain structure as evidenced by satellite spots in the Fourier transforms of the STM images. In the triclinic (T) phase, the STM data indicate that the CDW is in a striped domain phase, which is significantly different from the domain model previously proposed. Finally, in the high-temperature incommensurate (I) phase, we find unexpected satellite spots in the STM Fourier transforms, suggesting that a CDW modulation is also present in this phase.

Novel YBa2Cu3O7-x and YBa2Cu3O7-x/Y4Ba3O9 Multilayer Films by Bias-Masked 'On-Axis' Magnetron Sputtering.
Final rept.
J. H. Xu, G. G. Zheng, A. M. Grishin, J. Moreland, B. M. Moon, and K. V. Rao. 1994, 3p.
Pub. in Applied Physics Letters 64, n14 p1874-1876, 4 Apr 94.

Keywords: *YBCO superconductors, *Superconducting films, *Dielectric films, High temperature superconductors, Scanning tunneling microscopy, Strontium titanates, Magnetrons, Sputtering, Substrates, Reprints, *Yttrium barium cuprates, Lanthanum aluminates, Multilayers.

In situ YBa2Cu3O(7-x) (YBCO) films have been fabricated on SrTiO3 (001) and LaAlO3 (001) substrates by on-axis biased-radio-frequency magnetron sputtering in Ar-10% O2 at total pressures as low as 3 Pa (0.03 mbar) and a deposition rate 210 nm/h. Negative oxygen ion-resputtering has been considerably reduced by introducing a biased copper mask between the substrate and target. The surface morphology and physical properties of the films are greatly improved on applying a positive dc substrate bias with respect to grounded deposition chamber. We have obtained superconducting YBCO films with transport critical current as high as 10(exp 6) A/sq cm at 77 K and low normal-state resistivity by this approach. However, films deposited by negative dc bias under identical sputtering conditions are insulating. We identify the insulating films to be c-axis oriented Y4Ba3O9 (YBO) films. Furthermore, YBCO films could be grown on the YBO layers without any degradation of T(sub C) and c-axis orientation. This novel bias sputtering feature gives us a unique opportunity to produce superconductor/insulator, YBCO/YBO, multilayers from a single YBCO target.

Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers - Ultraviolet Technology V, San Diego, CA., July 26-27, 1994, v2282 p39-48.

Keywords: *Molecular beam epitaxy, *Epitaxial growth, *Gallium arsenides, Time-of-flight mass spectrometers, Vacuum ultraviolet radiation, Neodymium lasers, YAG lasers, Laser radiation, Photoionization, Reprints.

Epitaxial growth of III-V semiconductor materials is probed in a molecular beam epitaxy reactor by single photon ionization of the gaseous fluxes using vacuum ultraviolet (VUV) laser radiation. The ninth harmonic of the Nd:YAG laser is produced by frequency tripling the output to 355 nm and then to 118 nm in a Xe/Ar mixture. Together with a time-of-flight mass spectrometer, this radiation is used to selectively probe the gaseous fluxes of Ga, As, As2, and As4 during molecular beam epitaxy of III-V materials. The essential aspects of the method and details of calibration procedures to obtain relative fluxes are described. Recent work to correlate the flux determinations with Reflection High Energy Electron Diffraction (RHEED) oscillations during GaAs epitaxial growth will be discussed.

Early History and Future Outlook for the X-ray Crystal Density Method.
Final rept.
R. D. Deslattes. 1994, 7p.
Pub. in Metrologia 31, p173-179 1994.

Keywords: *Crystal structure, X ray diffraction, Historical aspects, Reprints, X ray interferometry, Avogadro constant.

It is useful to recall that the (late nineteenth-century) Baltimore Lectures of Lord Kelvin indicated that the likely sizes of atomic particles spanned almost two decades. Yet in the early years of the present century, Sir William Bragg's ansatz, together with the oil-drop e, gave the first reliable estimate of the scale of crystal interplanar spacings. The converse process of using an XRCD approach to obtain a value for the Avogadro constant was, prior to the advent of x-ray interferometry, limited by the need to connect optical and x-ray wavelengths before using the latter to estimate unit cell dimensions in crystals. Other limitations of these early measurements included the use of water as a density standard and the assignment of molar masses to individual specimens based on geochemical abundance averages. All these difficulties were overcome, in principle, with the application of x-ray/optical interferometry to the determination of lattice periods, the use of solid object density standards, and the determination of densities and isotopic abundances on individual monocrystalline specimens. While the present-day situation is addressed in other contributions to this workshop, the present essay attempts to place some of the early work in context and to look also to the future.

Epitaxial Growth of Sb/GaSb Structures: An Example of V/III-V Heteroepitaxy.
Final rept.
J. A. Dura, A. Vigliante, T. D. Golding, and S. C. Moss. 1995, 7p.
Sponsored by Army Research Office, Research Triangle Park, NC.
Pub. in Jnl. of Applied Physics 77, n1 p21-27, 1 Jan 95.

Keywords: *Gallium antimonides, *Gallium arsenides, *Antimony, *Molecular beam epitaxy, *Epitaxial growth, Semiconducting films, X ray diffraction, Crystal growth, Reprints, Heteroepitaxial films, Heterostructures.

The requirements for heteroepitaxial growth of Sb on both GaSb and GaAs, and the subsequent growth of GaSb on Sb, using molecular-beam epitaxy are described. These systems serve as examples of the heteroepitaxy of group-V elements with III-V compounds, i.e., between materials using different bonding and possessing different electronic properties. The quality of the films was determined using high-resolution four-circle x-ray diffraction, and comparisons were made between different structures. GaSb was found to grow (III) oriented on Sb (III) with an inverted stacking sequence. A simple epitaxial model is proposed to explain this.

Keywords: Scanning tunneling microscopy, Construction, Reprints, *Silicon nanocolumns, *Nanostructures, Nanolithography, Nanotechnology.

Voltage pulses to a scanning tunneling microscope (STM) are used to construct silicon columns of 30-100 A diameter and up to 200 A height on a silicon surface and on the end of a tungsten probe. These nanocolumns have excellent conductivity and longevity, and they provide an exceptional new ability to measure the shapes of nanostructures with a STM. This construction methodology and these slender yet robust columns provide a basis for nanoscale physics, lithography, and technology.

Deposition Rates in Direct Current Diode Sputtering.
Final rept.
G. C. Stutzin, K. Rozsa, and A. Gallagher. 1993, 10p.
Contract SERI-DD-1-11001-1
Sponsored by Solar Energy Research Inst., Golden, CO.
Pub. in Jnl. of Vacuum Science and Technology A 11, n3 p647-656 May/Jun 93.

Keywords: *Sputtering, Electric discharges, Direct current, Thin films, Silicon, Reprints, Deposition rates, Sputtered films.

A physical model for anode deposition rates in parallel-plate, dc-diode sputtering is presented and tested. The deposition rate has been measured as a function of the discharge voltage, the anode-cathode gap and the pressure, using silicon or molybdenum cathodes with argon. Deposition rates as high as 23 A/s were obtained using 3 kV, and it is shown that deposition efficiency is similar to that obtained with magnetrons. The deposition rate varies inversely with anode-cathode gap at constant pressure and voltage and almost linearly with power density for discharge voltages above a threshold which depends on the cathode material. These observations are explained by the model, which can be used to estimate the deposition rates for any cathode material and gas for which the ion sputtering yields are known. Potential advantages and complications of dc diode sputtering for thin film deposition are discussed, and optimum conditions for high, uniform deposition rates are described.

Surface Modification of YBa2Cu3O7-delta Thin Films Using the Scanning Tunneling Microscope: Five Methods.
Final rept.
R. E. Thomson, J. Moreland, and A. Roshko. 1994, 13p.
Pub. in Nanotechnology 5, p57-69 1994.

Keywords: *YBCO superconductors, *Superconducting films, High temperature superconductors, Scanning tunneling microscopy, Thin films, Reprints, *Yttrium barium cuprates, *Surface modification, Nanolithography.

We have investigated using the scanning tunneling microscope (STM) as a tool for surface modification of YBa2Cu3O(7-delta) (YBCO) thin films and have identified five distinct methods whereby the STM tip can modify the superconductor surface. (i) By lowering the tunneling resistance we make the tip scratch or 'mill' the sample surface mechanically. (ii) By increasing the bias voltage above about 4 V we can modify the surface by an apparent electron beam damaging process. (iii) By increasing the bias voltage above 10 V and raising the tunneling current, we can cause a more dramatic effect which is probably due to a thermal process. (iv) By operating the STM in a damp carbon dioxide atmosphere we can cause the STM tip to etch the surface electrochemically. (v) Finally, we have some preliminary data suggesting that the high field under an extremely sharp tip displaces the oxygen atoms in the YBCO lattice. Examples of each of these techniques are shown and discussed.

Keywords: *Diamonds, *Thin films, *Meetings, Vapor deposition, Electron emission, Cutting tools, Crystallization, Nucleation, Optics, Brazing, Wear, Composite materials, Models.

Interest in commercializing diamond technology and related materials technologies continues to grow. This can be attested to by the large number of abstracts received for this meeting, the Third International Conference on the Applications of Diamond Films and Related Materials. More than 300 abstracts were received. Cutting tools coated with CVD diamond are of immediate commercial interest. Other applications, such as diamond windows and diamond heat spreaders, are developing but at a slower pace. Interest in cubic boron nitride is receiving more attention because of its resistance to oxidation and because it can be used on tools to machine ferrous materials.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2915-2918 Jun 95.

Keywords: *Josephson junctions, *Electric potential, *Arrays, *Transition temperature, Comparative evaluations, High temperature, Bias, YBCO superconductors, Epitaxy, Heterojunction devices, Electric current, Resistance, Reprints, SNS junctions, Shapiro steps, Voltage-standard arrays.

The authors have explored two high-transition temperature Josephson junction technologies for application in voltage standard arrays: step-edge junctions made with YBa2Cu3O(7-delta) and Au normal-metal bridges, and stacked series arrays of Josephson junctions in selectively doped, epitaxially grown Bi2Sr2CaCu2O8 heterostructures. For both kinds of junctions, Shapiro steps induced by a microwave bias were characterized as a function of power. The authors compare the two technologies with respect to critical current and normal resistance uniformity, maximum achievable critical current, critical-current normal resistance product, and operating temperature.

Pub. in Applied Physics Letters, v66 n19 p2588-2590, 8 May 95.

Keywords: *Metrology, *Electron tunneling, *Capacitance, Capacitors, Electric bridges, Cryogenic equipment, Precision, Ratios, Electron spectroscopy, Superconductivity, Electrometers, Reprints, SET(Single electron tunneling).

A metrological application is reported of the single electron tunneling (SET) phenomena: a precise measurement of the ratio of two cryogenic capacitors. The measurement used a superconducting SET electrometer as the null detector for a capacitance bridge. A 3-ppm level of imprecision has been achieved in the measurement of the capacitance ratio from 100 to 1000 Hz. Further improvements can be made in the attempt to obtain an imprecision of 10(exp -8) at lower frequencies, sufficient for the metrological measurement of capacitance or the fine-structure constant using a SET pump.

Physical Basis for Half-Integral Shapiro Steps in a DC SQUID.
Final rept.
E. A. Early, A. F. Clark, and C. J. Lobb. 1995, 13p.
Pub. in Physica C, v245 p308-320 1995.

Keywords: *SQUID(Detectors), *Direct current, *Josephson junctions, Alternating current, Dynamic characteristics, Equations of motion, Projectory analysis, Energy storage, Potential, Reprints, DC SQUID, AC Josephson effect, Shapiro steps.

The dynamics of a DC SQUID is analogous to the classical dynamics of a particle subject to conservative,

damping, and driving forces in two dimensions. The equations of motion define a trajectory on a potential-energy surface derived from the conservative forces, the components of which correspond to different forms of stored energy in the SQUID. In the presence of a periodic driving force, half-integral Shapiro steps are possible when the trajectory follows a zig-zag path between minima of the potential surface. This description of the dynamics in terms of a potential surface provides an intuitive, physical basis for previous simulation results on half-integral Shapiro step in a DC SQUID.

Keywords: *Josephson junctions, *Molecular beam epitaxy, Phase locked systems, High temperature, Current density, Superconductors, Alternating current, Wafers, Layers, Reprints.

The authors report on the properties of stacked series arrays of trilayer Josephson junctions grown by atomic layer-by-layer molecular beam epitaxy. Trilayer Josephson junctions oriented so that the current travels in the c-axis direction have been described previously. Series arrays are made by placing more than one barrier layer in the Ba2Sr2CaCu2O8-based, (2212), epitaxial structure. Single molecular layers of 2212 doped with Dy to reduce the local carrier concentration are used as barriers, and are placed very close to each other, e.g., separated by only a few molecular layers of the superconducting phase. Phase locking of a.c. Josephson currents has been observed. The critical current density of such junctions has been observed to be very uniform on wafers that are free of second phase defects, and operation up to 60 K has been obtained.

Lattice Dynamics of Semiconducting, Metallic, and Superconducting Ba1-xKxBiO3 Studied by Inelastic Neutron Scattering.
Final rept.
M. A. Green, K. Prassides, D. A. Neumann, and P. Day. 1995, 6p.
Pub. in Chemistry of Materials, v7 p888-893 1995.

Keywords: *Crystal lattices, *Superconductors, *Semiconductors(Materials), *Neutron scattering, Chemical composition, Phase diagrams, Temperature, Energy levels, Phase transformations, Barium oxides, Potassium, Bismuth oxides, BCS theory, Reprints.

Inelastic neutron scattering has been used to study the lattice dynamics in Ba(1-x)KxBiO3 over a wide range of compositions, covering regions of the (composition (x), temperature (T)) phase diagram displaying semiconducting, metallic, and superconducting behavior. Modes are assigned using interatomic potentials calculations, which show good agreement with experiment. The oxygen phonon modes are very sensitive to changes in composition and oxidation state of the Bi ions. Phonon anomalies observed in both the oxygen TO bending (about 33 meV) and stretching (about 62 meV) modes as a function of temperature are discussed within the context of the BCS theory. Novel behavior is shown by the LO oxygen bending mode at about 42 meV that shows a strong dependence on composition, proposed to arise from the occurrence of structural phase transitions in this system.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p3061-3064 Jun 95.

Keywords: *Josephson junctions, *Superconductors, *Heterodyning, *Hot electrons, High temperature, Infrared radiation, Signal mixing, Bias, Microwaves, Reprints, SNS Josephson junctions, High Tc Josephson junctions.

The authors have investigated YBz2Cu3O7-delta superconductor- normal-superconductor Josephson junctions as mixers of 30THz radiation. The authors have directly observed (2nd order) differencefrequencies from 10 MHz to 12.8 GHz between two CO2 laser lines. Applying a third microwave signal to the junction, the authors have observed CO2 laser difference frequencies up to 27 GHz. The d.c. bias dependence of the difference frequency signal, as well as other evidence, suggests two distinct mixing mechanisms: hot-electron mixing in the junction banks at high d.c. biases, and bolometric Josephson mixing at low d.c. biases. The latter is the first observation of Josephson mixing at CO2 laser frequencies in high-T(sub C) junctions. The Josephson mixing has generated observable mixing products up to 6th order.

Effect of Stoichiometry on the Phases Present in Boron Nitride Thin Films.
Final rept.
L. B. Hackenberger, L. J. Pilione, R. Messier, and G. P. Lamaze. 1994, 7p.
Pub. in Jnl. of Vacuum Science and Technology A 12, n4 p1569-1575 Jul/Aug 94.

Keywords: *Boron nitrides, *Thin films, *Stoichiometry, Nondestructive tests, Neutron absorption, Chemical composition, Solids, Phase, Chemical analysis, Reprints, NDP(Neutron depth profiling).

Boron nitride thin films were deposited by ion-assisted evaporation and characterized by neutron depth profiling (NDP), a nondestructive method for the compositional analysis of solids. The phases present in the films were determined by infrared spectroscopy. Examination of the data presented here and comparison with the work of other authors revealed that stoichiometric or nearly stoichiometric films contained the greatest amount of the cubic phase. This led to the proposition that film stoichiometry is one of the factors that stabilize cubic boron nitride in boron nitride thin films. A shift in the position of the cubic boron nitride infrared absorption was also observed by the present authors which was related to film stoichiometry.

Q. Huang, J. W. Lynn, Q. Xiong, and C. W. Chu. 1995, 9p.
Pub. in Physical Review B, v52 n1 p462-470 Jul 95.

Keywords: *Mercury oxides, *Crystal structure, *Superconductivity, Phase transformations, Mercury compounds, Oxygen, Barium, Copper, Lattice parameters, Doped crystals, Temperature, Reprints.

Powder neutron-diffraction profile refinement techniques have been used to investigate the oxygen dependence of the crystal structure and its effect on the superconducting phase transition in high-quality samples of the superconductor HgBa2CuO(4+delta) (0.04 less than or equal to delta less than or equal to 0.23). The sustem remains tetragonal (space group P4/mmm) over the full range of temperature (10-300 K) and oxygen concentration explored. The a-axis lattice parameter decreases smoothly with increasing delta, while the c-axis lattice parameter exhibits a maximum. The extra oxygen in the material is found to randomly occupy the centered O(3) site (1/2, 1/2, 0) in the Hg layer, and no other additional site for the extra oxygen was found in the structure. There is also no mixing of the cations on the Cu and Hg sites.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2690-2693 Jun 95.

Keywords: *SQIDS(Detectors), *Radiation counters, *Phonons, Transitions, Edges, Tungsten, Thin films, Silicon, Substrates, Feedback, Temperature, Superconductors, Reprints.

The authors are developing and testing a new type of superconducting transition edge sensor for phonon mediated particle detection. This sensor consists of a superconducting tungsten thin film deposition on a silicon substrate. The temperature of the film is held constant within the superconducting transitions (T(sub c) = 70 mK) by a feedback process, with the substrate temperature well below the film temperature. Phonon energy deposited in the film is removed by a reduction in feedback Joule heating, which is measured using a series array of DC SQUIDs. The resulting signals show improvements in linearity and signal-to-noise ratio over the authors' previous transition edge sensors.

Tensile Deformation-Induced Microstructures in Free-Standing Copper Thin Films.
Final rept.
R. R. Keller, J. M. Phelps, and D. T. Read. 1994, 6p.
Pub. in Materials Research Society Symposia Proceedings, v338 p227-232 1994.

Keywords: *Thin films, *Copper, *Microstructure, *Tensile deformation, Dislocations(Materials), Fractures(Materials), Reliability, Electron microscopy, Loads(Forces), Plastic deformation, Reprints, TEM(Transmission electron microscopy).

Existing work in the mechanical behavior of thin films focuses mainly on measurement of macroscopic properties without string correlation to microstructural features. The authors used transmission electron microscopy (TEM) to characterize the microstructures of free-standing copper thin films both before and after monotonic tensile deformation in an ex-situ thin film tensile testing system, as well as during in-situ loading in the TEM. The defect structures contributing to plastic deformation were investigated with an emphasis on comparison to mechanisms known to operate in bulk copper. The thin film exhibited much lower ductility (approximately 1%) than that normally observed in bulk form (greater than 40%). The predominant plastic deformation mechanisms did not include the typical dislocation activity that occurs in bulk copper, but rather greatly inhibited dislocation interactions typical of stages I and II hardening only.

Magnetostriction and Giant Magnetoresistance in Annealed NiFe/Ag Multilayers.
Final rept.
Y. K. Kim, and S. C. Sanders. 1995, 3p.
Pub. in Applied Physics Letters 66, n8 p1009-1011, 20 Feb 95.

Keywords: *Magnetostriction, *Magnetoresistivity, *Annealing, *Thin films, Temperature dependence, Nickel compounds, Iron compounds, Gold, Stress relieving, Sensors, Magnetic tape, Recording heads, Reprints, GMR, Multilayers.

Magnetostriction data are reported for NiFe/Ag multilayer thin films displaying giant magnetoresistance. Magnetostriction and magnetoresistance were measured as functions of annealing temperature for NiFe/Ag samples having different numbers of NiFe/Ag bilayers and Ag spacer thicknesses. They varied systematically with annealing temperature in a manner consistent with residual stress reduction and microstructural changes such as grain-boundary diffusion and grain growth. Zero magnetostriction concurrent with high magnetoresistance ratio (5%) and field sensitivity (7.5%(kA/m)(0.6%/Oe)) was observed for an optimal multilayer configuration and annealing temperature. This combination of zero magnetostriction and high magnetoresistive response makes the NiFe/Ag multilayer system an attractive candidate for high-performance magnetic recording read-head sensors.

Optically Stabilized Tunable Diode-Laser System for Saturation Spectroscopy.
Final rept.
M. Murtz, M. Schaefer, T. George, J. S. Wells, and W. Urban. 1995, 7p.
Pub. in Applied Physics B, v60 p31-37 1995.

Keywords: *Saturation spectroscopy, *Lead salt diode lasers, *Laser applications, Tunable lasers, Diodes, Lasers, Reprints, *Foreign technology, Optical Feedback.

We present an optically stabilized lead-salt diode-laser system which is the nucleus of a very-high resolution instrument for sub-Doppler molecular spectroscopy in the mid-infrared. By application of external optical feedback, we have narrowed the diode-laser linewidth by two orders of magnitude, yielding a spectral width of less than 200 kHz. The diode-laser frequency is stabilized and controlled via the external reflector by variable-frequency offset-locking the diode-laser to a CO laser frequency. This substantial improvement in the spectral properties enabled us to perform a Lamb-dip experiment on a carbonyl sulfide (OCS) absorption line near 1985 cm-1.

Electronic Microrefrigerator Based on a Normal-Insulator-Superconductor Tunnel Junction.
Final rept.
M. Nahum, T. M. Eiles, and J. M. Martinis. 1994, 3p.
Pub. in Applied Physics Letters, v65 n24 p2123-2125 Dec 94.

Keywords: *Tunneling(Electronics), *Superconductors, *Refrigerators, Reprints, Junctions, Electro phonon coupling.

We present measurements on a novel electronic microrefrigerator that can cool conduction electrons significantly below the lattice temperature. A normal-insulator-superconductor tunnel junction is used to extract electrons from the normal metal electrode whose energy is higher than the Fermi energy. Electrons with an average energy equal to the Fermi energy are returned to the metal by a superconducting contact. Consequently, the high-energy thermal excitations are removed from the normal metal, thus cooling the electrons. For lattice temperatures higher than 100 mK the data can be explained by a simple theory incorporating the BCS density of states in the superconducting electrode and the coupling between electrons and phonons. At lower temperatures our measurement suggests that the electron energies in the normal electrode depart strongly from an equilibrium distribution.

Keywords: *Josephson junctions, *Integrated circuits, *Superconductors, *Fabrication, Low temperature, Very large scale integration, Thin films, Vapor deposition, Cyclotron resonance, Silicon dioxide, Experimental design, Statistical quality control, Reprints.

A superconducting integrated circuit fabrication process has been developed to encompass a wide range of applications such as Josephson voltage standards, VLSI scale array oscillators, SQUIDS, and kinetic-inductance-based devices. An optimal Josephson junction low temperature processing for all deposition and etching steps. This low temperature process involves an electron cyclotron resonance-based plasma-enhanced chemical vapor deposition of SiO2 films for interlayer dielectrics. Experimental design and statistical process control techniques have been used to ensure high quality oxide films. Oxide and niobiom etches include endpoint detection and controlled overetch of all films. An overview of the fabrication process is presented.

Pub. in Materials Research Society Symposia Proceedings, v336 p49-54 1994.

Keywords: *Surface roughness, *Films, *Silicon, Amorphous materials, Vapor deposition, Topology, Microscopy, Crystal growth, Voids, Substrates, Reprints, Hydrogenated amorphous silicon, Scanning tunneling microscopy.

A scanning tunneling microscope has been used to study the topology of the surface of device-quality, hydrogenated amorphous silicon deposited by rf discharge from silane or hot wire CVD. The substrates were oxide-free single-crystal silicon or GaAs. Films studied were either grown in the authors' laboratory and observed with no air exposure, or grown at other laboratories producing device-quality photovoltaic cells and viewed after air exposures of less than 30 minutes. Thin films (10 nm) representing early growth stages appear significantly smoother than the thicker films. The topology of thick films (greater than 50 nm) has large variations over individual samples. Overall surface roughness measured on sub-micron areas of the authors' films is very inhomogeneous.

Stable Phase Locking in a Two-Cell Ladder Array of Josephson Junctions.
Final rept.
B. H. Larsen, and S. P. Benz. 1995, 3p.
Pub. in Applied Physics Letters, v66 n23 p3209-3211 Jun 95.

Keywords: *Josephson junctions, *Arrays, Magnetic fields, Stability, Numerical analysis, Oscillators, Reprints, *Phase locking.

The stability of the periodic solution of the two-cell ladder array has been numerically investigated in order to explore intrinsic phase-locking mechanisms relevant to arrays and stacked junction oscillators. In zero magnetic field the periodic in-phase solution of the system

is neutrally stable. However, this solution is stable over a finite voltage range when an applied control current exceeds a critical value. The dependence upon system parameters of the boundaries of the stable range and the critical control current is investigated. Finally, the influence of the control current on the microwave power in a typical range of stability is calculated.

Keywords: *Josephson junctions, *Critical current, *Temperature dependence, *Magnetic fields, Gold, Modulation, Electrical properties, Transport properties, Superconducting devices, YBCO superconductors, Reprints, Step-edge SNS YBCO/Au junctions.

The authors compare the electrical transport properties of superconductor-normal metal-superconductor SNS step-edge YBCO/Au junctions where the Au is deposited at 100 deg C and 600 deg C. For both types of junctions the authors observe Resistively Shunted Junctions (RSJ) current-voltage characteristics. The critical currents Ic in all cases are similar for a given YBCO thickness to step height ratio, while the normal resistance R(sub n) for the Au deposited at 600 C is consistently 25% lower. The normalized temperature dependence of the I(sub c)R(sub n) product is identical for all junctions with Au deposited at high temperatures and varies among junctions on a single chop for Au deposited at 100 deg C. Low magnetic field modulation of the critical current can show either the expected Fraunhoffer-like pattern or a double-junction modulation for both types of devices. The modulation period is consistently a factor of three lower for the high-temperature deposited Au.

S. L. Wipf, and L. D. Cooley. 1994, 4p.
Pub. in Proceedings of the International Workshop on Critical Currents in Superconductors, Alpback, Austria, January 24-27, 1994, p613-616.

Keywords: *Flux pinning, *Superconducters, Reprints, Niobium titanium, Efficiency, Force, *Foreign technology.

An experimental study of artificial pinning centers in NbTi covered a large range of many parameters: size of pints from 65nm down to 7.7nm (Pins spaced at twice their size in hexagonal array), critical current densities at tempertures between 2K and Tc at fields up to Bc2. The objective of this paper is to understand mainly the field dependence of flux pinning in this material with a view to achieve optimal performance in a practical conductor. We conclude that in these samples the optimal pinning at 5T is between 14 and 28 nm pin size and that the pinning is within a factor of 4 plus or minus 1 of the ultimate possible.

Distribution of Dielectric Relaxation Times and the Moment Problem.
Final rept.
J. Baker-Jarvis, and M. D. Janezic. 1994, 2p.
Pub. in Proceedings of the Conference on Precision Electromagnetic Measurements (CPEM), Boulder, CO., June 27-July 1, 1994, p356-357.

Keywords: *Permittivity, Reprints, Maximum entry method, *Dielectric relaxation, *Moment problem.

A procedure for deconvolving time-dependent distribution functions from permittivity data is developed. The problem is reduced to solving an associated moment problem. This moment problem is then solved using a maximum-entropy procedure. A new algorithm for approximating the associated Lagrange multipliers in the distribution function is also outlined. The method is applied to permittivity modeling both for in-band and out-of-band regions. The numerical results indicate that the technique has potential for deconvolving the distribution function from the permittivity data.

Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v3 n1 p2724-2727 Mar 93.

Keywords: *Elecron microscopy, *Superconducting magnets, Reprints, Low temperature, Integrated circuits, *2D arrays, *Fluxon oscillations, *Josephson junctions.

We used the technique of Low Temperature Scanning Electron Microscopy for spatially resolved investigations of both Josephson junctions and superconducting integrated circuits during their operation with a spatial resolution of about 1 micrometer. Two examples of our studies will be presented. With single Josephson tunnel junctions of various geometries we studied different dynamics states such as fluxon oscillations or unidirectional flux flow. With an integrated circuit consisting of a two-dimensional array of tunnel junctions and an rf detection circuit we investigated the rf-properties of the coupling circuit and confirmed the existence of an impedance mismatch and a geometrical standing wave in the blocking capacitor.

Measured Stopping Powers of Hydrogen and Helium in Polystyrene Near Their Maximum Values.
Final rept.
L. Leblanc, G. G. Ross, and W. E. Wallace. 1995, 6p.
Pub. in Nuclear Instruments and Methods in Physics Research B, v95 p457-462 1995.

Keywords: *Energy losses, *Backscattering, *Stopping power, Reprints, Ion beams, Polymers, Hydrogen, Helium.

Rutherford backscattering at two different angles on multilayer targets is used to measure the stopping powers of hydrogen and helium ions in polystyrene in the energy range near their maximum values. In the energy range from 40 to 300 keV/amu, the hydrogen stopping power reaches a maximum value of 9.8 eV/10 to the 15th power atoms/cm. sq. at 81 keV/amu. As the energy increases from 25 to 90 keV/amu, the helium stopping power increases from 15.7 to 26.0 eV/(10 to the 15th power atoms/cm.sq.). Identical results (in keV/amu energy units) were obtained for 2H and 1H, as well as for 4He and 3He. The hydrogen and helium measured stopping power values are compared to the results calculated from two empirical models (Bragg's rule and the cores-and-bonds model). A function has been fit to the experimental data, including those previosly published, which permits rapid calculation of the stopping powers.

Spectroscopic Study of Quantized Breakdown Voltage States of the Quantum Hall Effect.
C. F. Lavine, M. E. Cage, and R. E. Elmquist. 1994, 8p.
Included in Jnl. of Research of the National Institute of Standards and Technology, v99 n6 p757-764 Nov/Dec 94.

Keywords: *Spectroscopic analysis, *Electric potential, *Electrical faults, *Hall effect, Quantum theory, Semiconductors(Materials), Electron gas, Spectra, Solid-state plasma, Energy losses, Dissipation factor, Histograms, Two dimensional, NIST(National Institute of Standards and Technology).

Quantized breakdown voltage states are observed in a second, wide, high-quality GaAs/AlGaAs sample made from another wafer, demonstrating that quantization of the longitudinal voltage drop along the sample is a general feature of the quantum Hall effect in the breakdown regime. The voltage states are interpreted in a simple energy conservation model as occuring when electrons are excited to higher Landau levels and then return to the original level. A spectroscopic study of these dissipative voltage states reveals how well they are quantized. The statistical variations of the quantized voltages increase linearly with quantum number.

Measurement of the Weak-Localization Complex Conductivity at 1 Ghz in Disordered Ag Wires.
Final rept.
J. B. Pieper, J. C. Price, and J. M. Martinis. 1992, 4p.
Pub. in Physical Review B, v45 n7 p3857-3860 Feb 92.

Keywords: *Magnetoconductance, Reprints, *Electron diffusion constant, *Weak localization.

The authors have measured the complex magnetoconductivity of disordered quasi-dimensional Ag wires at 1 GHz and at 200 Hz. Because 1 GHz is of the same order as the dephasing rate, the authors have been able to observe the frequency dependence

of weak localization. Both the real and imaginary parts of the conductivity at 1 GHz are in good agreement with theory. The data yield an accurate value for the electron diffusion constant, which is not well determined by dc measurements, and support the theory of weak localization at finite frequency.

M. D. Hill, J. E. Blendell, C. K. Chiang, L. Chacon, J. F. Kelly, L. H. Bennett, and J. J. Ritter. 1995, 5p.
Pub. in Physica C, n251 p361-365, 7 Jul 95.

Keywords: *Critical current, *Superconductors, *Sintering, Transport properties, Current density, Superconductivity, Solid solutions, Microstructure, Samarium, Barium oxides, Copper oxides, Yttrium oxides, Reprints, *YBCO superconductors, High temperature superconductors, Weale-links.

The addition of Sm2BaCuO5 to YBa2Cu3O(6+x) has been shown to increase the transport critical current density. Because Sm2BaCuO5 and CuO do not coexist at equilibrium, additions of Sm2BaCuO5 to YBa2Cu3O(6+x) cause a reaction with the Cu rich liquid phase usually present during sintering. This forms crystalline phases that do not completely cover the grain boundaries. Sm was found to be homogeneously distributed in the YBa2Cu3O(6+x), matrix. Additions of 5 mole% Sm2BaCuO5 and sintering temperatures of 950 deg. C are effective in increasing the transport critical current density.

Keywords: *Cryogenics, Reprints, Electronics, Pulse tube, Refrigeration, Superconductors, *Cryocoolers, Brayton, Gifford-McMahon, Joule-Thomson, Stirling.

The lack of satisfactory cryocoolers designed specifically for superconducting electronics has hindered the marketability of superconducting devices. This article reviews the current status of the five most common cryocoolers: Joule-Thomson, Brayton, Stirling, Gifford-McMahon, and pulse tubes. Advantages and disadvantages of each type of commercially available cryocoolers are given. Most of these cryocoolers have been developed for the cooling of infrared sensors and can sometimes be adapted for use with superconducting electronics. Current areas of research are discussed and some projections for the future are given.

Novel Method for Determining Thin Film Density by Energy-Dispersive X-ray Reflectivity.
Final rept.
W. E. Wallace, and W. L. Wu. 1995, 3p.
Pub. in Applied Physics Letters, v67 n9 p1203-1205 Aug 95.

Keywords: *Thin films, *X ray density measurement, Reflectance, X rays, Wavelengths, Alignment, Silicon dioxide, Single crystals, Reprints, Spin-on-glass, Polysilsesquioxane.

A technique utilizing the reflection of x-rays to determine material density at flat surfaces is described. The effects of sample misalignment limit the accuracy of x-ray reflectivity as typically practiced. These effects may be properly accounted for by measuring the critical angle for reflection at many different x-ray wavelengths simultaneously from which an extrapolation of the position of the critical angle at infinite wavelength may be made. This extrapolation has the effect of correcting for sample misalignment. Use of the technique is demonstrated for single-crystal silicon surfaces and for silica spin-on-glass thin films.

Characterization of Liquid-Phase Epitaxially Grown HgCdTe Films by Magnetoresistance Measurements.
Final rept.
J. S. Kim, D. G. Seiler, L. Colombo, and M. C. Chen. 1995, 6p.
Pub. in Jnl. of Electronic Materials, v24 n9 p1305-1310 1995.

Keywords: *Magnetoresistance, *Films, Epitaxy, Magnetic properties, Reprints, HgCdTe.

In this paper, we demonstrate that measurements of the magnetoresistance can be used as a valuable alternative to conventional characterization tools to study transport properties of advanced semiconducting materials, structures, or devices. We have measured magnetoresistance on two different systems, namely, three liquid-phase epitaxially grown HgCdTe Films and two GaAs-based high-electron-mobility-transistor (HEMT) structures. The results are analyzed by using a two-carrier model as a reference in the context of the reduced-conductivity-tensor scheme. The HEMT data are in quantitative agreement with the two-carrier model, but the HgCdTe data exhibit appreciable deviations from the model. The observed deviations strongly indicate a mobility spread and material complexity in the HgCdTe samples which are probably associated with inhomogeneities and the resulting anomalous electrical behavior.

Keywords: *Grating, *Lasers, *Glass, Phosphate glass, Waveguide, Reprints, *Foreign technology.

We have successfully demonstrated waveguide lasers operating at 1056.1, 1058.2, and 1062.6 nm in Nd-doped phosphate glass. The waveguides were fabricated by potassium ion exchange from a nitrate melt. Distributed feedback grating patterns were holographically written at 458 nm in photoresist spun on the sample surfaces. The gratings were developed, coated with chromium at a 60-degree evaporation angle, and were then transferred into the glass by argon ion sputtering. Typical laser threshold was 32 mW of absorbed pump power at 805 nm with a corresponding slope efficiency of 2%.

Anisotropy of Interfaces in an Ordered Alloy: A Multiple-Order-Parameter Model.
R. J. Braun, J. W. Cahn, G. B. McFadden, and A. A. Wheeler. Apr 95, 70p, NISTIR-5641.
Prepared in cooperation with Delaware Univ., Newark. Dept. of Mathematical Sciences. Sponsored by Southampton Univ. (England). Faculty of Mathematical Studies.

Keywords: *Face centered cubic lattices, *Alloys, Anisotropy, Lattice parameters, Crystal symmetry, Phase transformations, Binary systems(Materials).

The authors develop a diffuse-interface theory of ordering of a binary alloy on a face-centered-cubic (FCC) crystal lattice. A continuum, multiple-order-parameter theory is used that incorporates the underlying symmetries of the FCC crystal in both the bulk and gradient-energy terms of the free energy. With the theory the authors are able to compute interphase and antiphase boundaries for general orientations with respect to the fixed crystal axes. The authors are able to compute the structure of these interfaces, which compare very well with previous calculations by Kikuchi and Cahn using the cluster variation method. For the parameters the authors have studied, they find that the anisotropy of the surface free energy is not sufficiently strong to cause edges or corners in equilibrium shapes.

Coexistence of Grains with Differing Orthorhombicity in High Quality YBa2Cu3O7-delta Thin Films.
Final rept.
E. I. de Obaldia, K. F. Ludwig, S. J. Berkowitz, P. M. Mankiewich, D. A. Rudman, A. Roshko, R. Moerman, L. Vale, R. H. Ono, A. M. Clark, and W. J. Skocpol. 1994, 3p.
Pub. in Applied Physics Letters, v65 n26 p3395-3397 Dec 94.

Keywords: *Thin films, *X ray diffraction, *Lasers, Reprints, *Pulsed laser deposition, YBCO.

High quality films of YBa2Cu3O7-sigma on LaAlO3 have been grown by pulsed-laser deposition at oxygen pressures of 2.4-54 Pa (25-400 mTorr). X-ray diffraction reveals the coexistence of grains that align with the substrate axes (axial grains). The axial grains are tetragonal while the diagonal grains achieve lattice parameters close to bulk YBa2Cu3O7. The relative proportion of axial grains accounts for the measured variations of normal-state conductance and superconducting critical current density from film to film, based on a simple two-dimensional model of randomly positioned, insulating axial grains.

Accuracy of the Electron Pump.
Final rept.
H. D. Jensen, and J. M. Martinis. 1992, 21p.
See also PB95-168910 and PB95-175873.
Pub. in Physical Review B, v46 n20 p407-427 Nov 92.

Keywords: Metrology, Reprints, Tests, Accuracy, *Electron pumps, Single electron tunneling, Coulomb blockage, Cotunneling.

The authors calculate the accuracy of the single electron pump numerically and analytically. With a biasing of the device that the authors describe as optimal, the accuracy is computed with finite temperature cotunneling rates that systematically include all possible cotunneling processes. A simple graphical representation of the operation of the pump illustrates when cotunneling processes become active. The authors show that the accuracy is limited by cotunneling, thermal activation, and operating the device at too high a frequency; simple approximation formulas are given for these errors. Metrological accuracy is attainable for devices with five or more junctions and with parameters that are experimentally attainable.

Mutual Phase Locking in Systems of High-Tc Superconductor-Normal Metal-Superconductor Junctions.
Final rept.
C. D. Reintsema, R. H. Ono, T. E. Harvey, N. Missert, and L. R. Vale. 1994, 11p.
Pub. in International Society for Optical Engineering, Los Angeles, CA., January 25-27, 1994, v2160 p208-218 Jul 94.

Keywords: *High temperature superconductors, *Superconductors, Reprints, *Phase locking, *SNS junctions.

The authors have investigated the interaction between high critical temperature (high-Tc) superconductor-normal metal-superconductor step-edge junctions coupled through a non-superconducting feedback loop. The authors have characterized the strength of the interaction as a function of frequency and temperature for both a circuit without a groundplane and an all high-Tc multilayer circuit incorporating a superconducting ground plane. The authors observed relative locking strengths (the ratio of the measured locking current IL to the junctions average critical current Ic) as large as IL/IC=9% and peak locking frequencies as high as 1.06 THz. The maximum temperature at which locking occurred was 35 K. An analysis of the temperature dependence of the locking current accounting for thermal fluctuations in the context of Johnson noise from resistive elements in the circuit agrees well with the authors' experimental observations.

Pub. in Ultimate Limits of Fabrication and Measurement, p181-188 1995.

Keywords: *Chromium, *Exchange coupling, *Magnetism, Reprints, Iron, Electron microscopy, Polarization, Microscopy, *Foreign technology.

Realizing the ultimate limits in fabrication requires the controlled placement of material at the single atomic layer limit. This precision is required for both semiconductor and magnetic devices, the two largest industries racing towards the Ultimate Limits in fabrication. In this report the authors summarize results on the effects of thickness fluctuations on the exchange coupling in Fe/Cr/Fe trilayer structures. This work demonstrates the importance of controlling thin film thickness at the single atomic layer level in magnetic systems.

R. B. Goldfarb. 1995, 12p.
Pub. in Magnetic and Electrical Separation, v6 p105-116 1995.

Keywords: *Magnetism, Units of measurement, Symbols, Reprints, Conversion factors.

An evening panel discussion on magnetic units, attended by 150 participants, was held at the 1994 Joint MMM-Intermag Conference in Albuquerque, New Mexico, USA. The season was organized by C.D. Graham, Jr., and moderated by R.B. Goldfarb. The panel members were asked to describe the use of magnetic units in the countries, and to make appropriate comments and recommendations. In addition to units, several panelists talked about distinction between magnetic induction B and magnetic field strength H, and the conversion of equations. After the panelists' opening statements, the floor was opened for questions and discussion from the audience. Below are the panelists' summaries of their remarks. By agreement with authors, this article is not subject to copyright.

Pub. in Applied Physics Letters, v66 n3 p373-375 Jan 95.

Keywords: *Magnetometers, Multilayers, Noise, Trilayers, Reprints, *Flux transformers, YBCO.

We have fabricated YB2Cu3O7-x-SrTiO3-YBa2Cu3O7-x (YBCO-STO-YBCO) trilayers, in which each layer is patterned photolithographically, capping the first YBCO film with an in situ STO film. Atomic force microscopy demonstrates that the capping process dramatically improves the quality of the surface of the second layer, allowing the growth of an upper YBCO film with a substantially reduced level of low-frequency flux noise. A magnetometer with a multiturn flux transformer coupled to a dc superconducting quantum interference device achieved a magnetic field noise of 74 fT Hz-1/2 at 1 Hz, improving to 31 fT Hz-1/2 at 1 kHz.

High-Energy Phonon Dispersion in La1.85Sr0.15CuO4.
Final rept.
A. H. Moudden, P. M. Gehring, G. Shirane, B. Hennion, Y. Endoh, I. Tanaka, H. Kojima, M. Matsuda, and L. Vasiliu-Doloc. 1995, 3p.
Pub. in Physica B Condensed Matter, v213-214 p72-74 1995.

Keywords: *Superconducting, Transverse, Longitudinal, Reprints, *Phonon dispersion.

The authors have measured two phonon-dispersion curves above 50 meV in a superconducting (Tc=33 K) single crystal of La1.8Sr0.15CuO4. In the normal phase (T=45 K), the authors show that the A1 mode compatible with the Raman A1g(425 cm-1) mode is weakly dispersive, falling from 53.7 meV at the zone center to about 51 meV at the zone boundary along the tetragonal (0.0) direction. For the A1 mode compatible with the infra-red A2u (480 cm to the minus one) mode, they observe a significant dispersion of the photonon energy which drops monotonically from 60 to 56 meV. The global features of these dispersion curves were similar to those previously reported in studies of both pure and 10% Sr doped La2CuO4. However significant differences in the shape of the dispersion of the highest A1 branch is shown, as well as a significant softening with increasing carrier concentration.

Electron-electron Interactions, Coupled-Plasmon-Phonon Modes, and Mobility in n-Type GaAs.
Final rept.
B. A. Sanborn. 1995, 9p.
Pub. in Physical Review B, v51 n20 p14 256-14 264 May 95.

Keywords: *Electron scattering, Mobility, Reprints, *Electron-electron interactions, GaAs, Coupled modes, Boltzmann equation, Dynamic screening.

The paper investigates the mobility of electrons scattering from the coupled system of electrons and longitudinal-optical (LO) phonons in n-type GaAs. The Boltzmann equation is solved exactly for low electric fields by an iterative method, including electron-electron and electron-LO-phonon self-energy is treated in the plasmon-pole approximation. Scattering from ionized impurities screened in static RPA is calculated with phase-shift cross sections and scattering from RPA screened deformation potential and piezoelectric acoustic phonons is included in the elastic approximation. The results show that dynamic screening and plasmon-phonon coupling significantly modify inelastic scattering at low temperatures and densities. The effect on mobility is obscured by ionized impurity scattering in conventionally doped material, but should be important in modulation doped structures. For uncompensated bulk n-type GaAs, the RPA phase-shift model for electron-impurity scattering gives lower drift mobilities than the standard Thomas-Fermi or Born calculations, which are high compared to experiment.

Development of Highly Conductive Cantilevers for Atomic Force Microscopy Point Contact Measurements.
Final rept.
R. E. Thomson, and J. Moreland. 1995, 3p.
Pub. in Jnl. of Vacuum Science and Technology B, v13 n3 p1123-1125 May/Jun 95.

Keywords: *Cantilevers, Contact resistance, Point contact, Reprints, *Atomic force microscopy.

Several techniques for improving the electrical conductivity of micromachined silicon cantilevers for atomic force microscopy point contact measurements were investigated. The techniques studied included sputtering or evaporating thin layers of gold, platinum or silver onto the lower surface of the cantilever to create a conducting metal layer, and doping the cantilevers with phosphorus. It was found that the lowest resistance contacts to a gold surface can be made by the metal coated tips, which can make stable point contacts with resistances as low as 30 omega at a tip sample force of 15 mu N.

Evidence for Tunneling and Magnetic Scatttering at 'In situ' YBCO/Noble-Metal Interfaces.
Final rept.
S. C. Sanders, S. E. Russek, C. C. Clickner, and J. W. Ekin. 1995, 6p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 n2 p2404-2407 Jun 95.

Keywords: *Conductance, *Electrical transport, Contacts, Reprints, Tunneling, Interfaces, Noble metals, *YBCO superconductors.

We report low-temperature conductance data for in situ YBa2Cu3O7-sigma (YBCO)/Au, and YBCO/Pt planar c-axis interfaces. Analysis of the conductance data for these interfaces, which have resistivities as low as 1 x 10 to the minus 8th power omega-cm2, indicates that tunneling is the predominant transport mechanism. Zero-bias conductance peaks are present for all of the in situ interfaces. These peaks are analyzed in the framework of the Appelbaum model and are attributed to the presence of isolated magnetic spins at the interface. The presence and similarity of the peaks for each noble-metal overlayer supports the hypothesis that the magnetic spins are inherent to the YBCO surface.

Keywords: *Crystal structure, *Lanthanum deuteride, Neutron diffraction, Reprints, Rare earths, Long range order.

Neutron-powder-diffraction patterns of the superstoichiometric rare-earth dideuteride LaD2.25 were measured between 15 and 400 K. Profile refinements indicated that, above approximately 345 K, the LaD2.25 structure is cubic (Fm3m) with deuterium fully occupying the tetrahedral (t) interstices of the fcc La lattice and the excess deuterium occupying a portion of the octahedral (o) interstices with full statistical disorder. As the temperature is decreased below approximately 345 K, the LaD2.25 structure undergoes a transformation to tetragonal symmetry concomitant with the onset of deuterium long-range order (I4/mmm) in the o sublattice. Fully developed long-range order is established near 230 K and ideally corresponds to the occare-earth-deuterium systems possessing similar D/Metal stoichiometric ratios. This ordering is accompanied by an outward expansion of the cubic ensemble of eight t-site deuterium atoms surrounding each o-site deuterium (Do) atom. Moreover, the c-directed La-Do bond distances are decreased by a displacement of the La atoms toward the Do atoms.

Keywords: *Superconductors, *Coils, Superconducting devices, Reprints, Fatigue degradation, NbTi, Residual resistivity, Stability strain, Quench energy.

In comparative measurements of small-scale epoxy-impregnated Cu-stabilized and Al/Cu-stabilized Nb-Ti test coils at 4 K and 5 T, the heat energy required to quench the Al/Cu-stabilized coil was 4 to 12 times greater than for the Cu-stabilized coil, depending on the relative operating current. Also, the coils' stabilizer resistivity (p) was measured as a function of mechanical fatigue to test for strain-induced degradation. The p of the Cu-stabilized coil is relatively unaffected by fatigue, while that of the Al/Cu-stabilized coil increases with fatigue. However, in these coils, having a typical stabilizer:superconductor ratio of 4:1, the degradation of the Al/Cu-stablized coil beings to saturate after several hundred fatigue cycles; after 2000 fatigue cycles to 0.2% strain, the p of the Al/Cu-stabilized coil is still 2.6 times lower than the p of the Cu-stabilized coil.

Keywords: Photon-atom collisions, Atomic force microscopy, Reprints, Microstructures, *Nanostructures, *Atom optics, Chromium atoms.

The drive for further miniaturization of electronic and magnetic devices continues to place increasing demands on the authors' abilities to fabricate very small structures and to understand and exploit the physical laws applicable in such devices. Optical lithographic techniques continue to be refined and limitations imposed by diffraction are driving the wavelength of the photons utilized toward the x-ray region. Still shorter wavelength particles, high energy electrons, are used for the highest resolution mask making. A logical extension of the progression would involve using atoms, because of their short de Broglie wavelength, as the pattern generating particle, either to expose a resist, or to deposit structures directly. The authors' are exploring how the techniques of atom optics, a field paralleling electron optics but utilizing neutral atoms instead of electrons, can be used to fabricate structures on the nanometer scale. This article is a brief summary of the authors' research on this topic. A more detailed treatment can be found elsewhere.

Oxygen Annealing of Ex-situ YBCO/Ag Thin-Film Interfaces.
Final rept.
J. W. Ekin, C. C. Clickner, S. E. Russek, and S. C. Sanders. 1995, 4p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Applied Superconductivity, v5 pt3 n2 p2400-2403 Jun 95.

Keywords: *YBCO superconductors, *Electric contacts, Thin films, Silver, Magnetic scattering, Reprints, *Anneling.

The resistivity of YBCO/Ag interfaces has been measured for different oxygen annealing temperatures for a series of ex-situ fabricated thin-film contacts having sizes ranging from 16 micrometers x 16 micrometers down to 4 micrometers x 4 micrometers. The interface resistivity began to decrease after annealing at 300 deg C for 10 minutes in one atmosphere oxygen. After annealing at 400 deg C, the contact resistivity decreased by several orders of magnitude to the 10 to the minus 7 power Omega-(cm)squared range. The 500-nm thick Ag layer showed massive surface diffusion and agglomeration for annealing temperatures above -400 deg C; this temperature thus represents a practical limit for oxygen annealing the TBCO/Ag interface system for more than 10 minutes. Rapid cooling of the chip after annealing led to a severe loss of critical current density in the YBCO layer, which could be restored by reannealing and cooling at a slower rate of 50 deg C/min.

Theory of the Magneto-Optic Kerr Effect in the Near Field.
Final rept.
V. A. Kosobukin. 1995, 7p.
Pub. in Proceedings of the International Society for Optical Engineering Near-Field Optics, San Diego, CA., July 9-10, 1995, v2535 p9-15.

Keywords: *Magneto-optical effects, Kerr effect, Near field, Reprints, Light scattering, Surface plasmons.

A theory is developed for the magneto-optic Kerr effect (MOKE) excited via an optical near field. The model under consideration includes a semi-infinite ferromagnet and a small non-magnetic metal particle which is located nearby and possesses a long-living surface plasmon. A multiple-scattering formulation of the problem is given. Considering the Rayleigh scattering of light and the magneto-optical light polarization conversion as elementary events, all the essential optical processes are classified, and those which contribute to the near-field excitation, is treated self-consistently to all orders in light-matter interaction, and the magneto-optical interaction is described in the first order approximation of perturbation theory. The scattered light field is discussed with special emphasis on the change of optical polarization due to MOKE.

Stagnant Film Model of the Effect of Natural Convection on the Dendrite Operating State.
Final rept.
R. F. Sekerka, S. R. Coriell, and G. B. McFadden. 1995, 7p.
Pub. in Jnl. of Crystal Growth, v154 p370-376 Apr 95.

Keywords: *Dendritic crystals, *Crystal growth, *Films, *Mathematical models, Convection, Heat transfer, Nusselt number, Fluid dynamics, Reprints.

We develop a simple model of the influence of natural convection on the selection of the operating state (dendrite tip velocity, V, and tip radius, rho) for dendritic growth of a pure material. We hypothesize that the important aspects if natural convection can be accounted for by considering the global convection that would occur in the vicinity of a sphere of radius R that characterizes the size of a dendritic array that is growing from a point source. We estimate the thickness, delta, of a stagnant boundary layer surrounding this sphere by matching the value of the Nusselt number obtained from the heat transfer literature. We solve the steady-state problem of a paraboloidal dendrite at temperature T(sub M) growing toward a confocal paraboloid at temperature T(sub infinity) located at a distance delta from the tip.

Magnetoresistance of Thin-Film NiFe Devices Exhibiting Single-Domain Behavior.
Final rept.
R. W. Cross, J. O. Oti, S. E. Russek, T. Silva, and Y. K. Kim. 1995, 3p.
Pub. in Institute of Electrical and Electronics Engineers Transactions on Magnetics, v31 n6 p3358-3360 Nov 95.

Keywords: *Magnetoresistivity, *Thin films, Nickel compounds, Iron compounds, Magnetization, Hysteresis, Devices, Single domain, Reprints, Barkhausen.

Rectangular NiFe stripes as small as 1 x 5 microm were fabricated and characterized as a function of film thickness. Gold current leads were sputtered and patterned onto the stripes so that magnetoresistance measurements could be performed. A uniform in-plane magnetic field was applied transverse to the stripe length and at various angles from the perpendicular direction. For film thicknesses greater than 10 nm, the magnetoresistance for all of the devices had large jumps and hysteresis due to domain formation. As the thickness of the film decreased below 10 nm, the domain structure disappeared for stripe heights 2 microm or less. Theoretical calculations of the magnetization reversals were obtained using a numerical implementation of the Stoner-Wohlfarth model for the switching of a single-domain ellipsoidal particle.

See also PB93-153369.
Pub. in Cryogenics, v35 VAMAS Supplement, pS19-S23 1995.

Keywords: *Superconductors, *Critical current, Electrical measurement, Comparative evaluations, Reprints, *Foreign technology, Thermal contraction.

The critical current Ic of a superconductor is a quantitative evaluation of its current carrying capacity, and is defined as the current at which a specified electric field criterion Ec, or resistivity criterion Pc is achieved in the specimen. Typical electric field and resistivity criteria are 10 to the minus one microm and 10 to the minus 14th power omega m, respectively. The voltage-current (V-I) characteristic of the superconductor can be modelled by the empirical equation V = V0(III0) sup n where I0 is the observed current at voltage V0. The value of n can be thought of as a 'figure of merit' for the conductor, and reflects the abruptness of the transition from the superconducting to the normal state, with typical values ranging from 10 to 100.

The authors conducted an interlaboratory comparison of critical current (Ic) measurements on Bi2Sr2Ca2Cu3O10 tapes (2223). The study includes measurements from six participating US laboratories, with NIST as the central, organizing laboratory. A number of specimens were prepared with different degrees of instrumentation to isolate sources of variability. Most of the specimens were pre-measured by NIST to reduce uncertainties due to sample variability. Different specimen routing patterns among the laboratories were implemented to isolate sources of variability due to the specimen's measurement history.

Pub. in Cryogenics, v35 VAMAS Supplement, pS29-S32 1995.

Keywords: *Superconductors, Comparative evaluations, Contraction, Electrical measurement, Reprints, *Foreign technology, *Niobium stannoides, *Critical current.

It is typical for Nb3Sn-Cu superconductor specimens to be wound into coils on tubular measurement mandrels for critical current measurements. If the thermal contraction of the mandrel is different from that of the specimen, either tensile or compressive axial strain could develop upon cooling from room temperature to liquid helium temperature, thus affecting the measured critical current Ic1.2. The amount of strain depends on the magnitude of the differential contraction, the relative strength of the specimen and mandrel, and the mechanical coupling between the specimen and its mandrel.

Microwave Noise in High-Tc Josephson Junctions.
Final rept.
E. N. Grossman, L. R. Vale, and D. A. Rudman. 1995, 3p.
Pub. in Applied Physics Letters, v66 n13 p1680-1682 Mar 95.

Keywords: *Josephson junctions, *YBCO superconductors, Noise, Mixing circuits, Heterodyning, Reprints, SNS junctions, Terahertz, Mixer.

The authors have measured the noise of YBa2Cu3O7-delta superconductor- normal-superconductor (SNS) junctions whose high normal-state resistances and characteristic frequencies make them suitable for THz frequency mixers. By directly measuring the 1 GHz powerspectral density delivered to a low-noise 50 Ohms radiometer system, thenoise could be measured over a wide range of dc voltage and temperature,without complications due to 1/f noise, and without invoking any specific model. The effective noise temperature of the normal resistanceis approximately equal to the physical temperature at high temperatures,but approaches a limiting value at low temperatures, implying an excess current noise of unknown origin.

V-6: Effects of Temperature Variation.
Final rept.
H. Kirchmayr, and L. F. Goodrich. 1995, 2p.
Pub. in Cryogenics, VAMAS Supplement, v35 pS99-S100 1995.

Keywords: *Superconductors, *Low temperature tests, *Interlaboratory comparisons, Temperature dependence, Liquid helium, Pressure, Cryostats, Reproducibility, Niobium stannides, Reprints, Critical current, Mandrel.

The critical current (Ic) of a NbTi or Nb3Sn superconductor specimen depends on its temperature. The pressure, and thus the liquid helium temperature, may vary between laboratories due to different altitudes and different cryostats used for the Ic measurement. Thus, it is necessary to study the temperature dependence of the specimen's critical current. This paper presents measurements of Ic as a function of temperature for tests carried out at the Technical University of Vienna (TUW) and the National Institute of Standards and Technology (NIST).

Pub. in Proceedings of the International Workshop on the Measurement and Characterization of Ultra-Shallow Doping Profiles in Semiconductors (3rd), Research Triangle Park, NC., March 20-22, 1995, p9.1-9.8.

Keywords: *Microscopy, *Scanning, *Semiconductor devices, *Silicon, Dopes, Profiles, Experimental data, Models, Reprints, AFM(Atomic force microscope), SCM(Scanning capacitance microscope).

A scattering capacitance microscope (SCM) has been implemented by interfacing a commercial contact-mode atomic force microscope (AFM) with a high-sensitivity capacitance sensor. SCM has promise as a next-generation dopant-profiling technique because the measurement is inherently two dimensional, has a potential spatial resolution limited by tip diameter of at least 20 nm, and requires no current carrying metal-semiconductor contact. Different capacitance images have been made with the SCM of a variety of bulk-doped samples and in the vicinity of pn junctions and homojunctions. Also, a computer code has been written that can numerically solve Poisson's equation for a model SCM geometry by using the method of collocation of Gaussian points.

Effects of Substrate Surface Steps on the Microstructure of Epitaxial Ba2YCu3O7-x Thin Films on (001) LaAlO3.
Final rept.
P. C. McIntyre, M. J. Cima, and A. Roshko. 1995, 10p.
Pub. in Jnl. of Crystal Growth, v149 p64-73 1995.

Keywords: *Epitaxy, *YBCO superconductors, *Thin films, Critical temperature, High temperature, Substrates, Crystal growth, Morphology, Reprints.

The effect of steps in the (001) surface of LaAlO3 substrates on the microstructural evolution of heteroepitaxial Ba2YCu3O7(7-x) (BYC) thin films were characterized by high resolution transmission electron microscopy (TEM) and atomic force microscopy (AFM). Native substrate surface steps acted as nucleation sites for both the c-axis normal and c-axis in-plane (a-axis normal) orientations in BYC films prepared by post-deposition annealing of a precursor film. The density of c-axis in-plane BYC grains varied dramatically across the surface of the substrates. In several samples. The spatial pattern of c-axis in-plane regions present in the BYC films was similar to the twin structure present in the LaAlO3 substrates.

J. A. Stroscio, D. T. Pierce, A. Davies, and R. J. Celotta. 1995, 4p.
Pub. in Physical Review Letters, v75 n16 p2960-2963 Oct 95.

Keywords: *Tunneling spectroscopy, *Surface states, Band structure, Reprints, Bcc (001) surfaces, Cr, Fe.

The authors have discovered an intense, sharp feature in tunneling spectra of the Fe(001) and Cr(001) surfaces that derives from a bcc surface state near the Fermi level. Band-structure calculations show that this state is a general feature of bcc(001) surfaces, and that it originates from a nearly unperturbed d orbital extending out into the vacuum region. This general feature should permit chemical identification with atomic spatial resolution on bcc(001) surfaces. The surface state is in the minority spin band for Fe and Cr, so it should be useful for future spin-polarized tunneling experiments.

Keywords: *Semiconductors, *Metrology, *Circuit technology, Analytical technology, Characterization, Microelectronics, Process development, Reprints.

Semiconductor characterization is an indispensable enabler of all modern microelectronics and optoelectronic circuit, and is in the critical path for maintaining the steady decline in cost-per-function of silicon integrated circuit technology. It is also driving new developments in compound semiconductor materials and devices (III-V and II-VI). In this overview, we present a perspective on measurement technology relative to business and economic challenges of the semiconductor industry, and illustrate the key role metrology plays in modern process development and manufacturing. We also describe how new characterization techniques evolve for semiconductor applications.

Keywords: *Spectroscopy, Reprints, GaAs, Heterostructure, Pressure, Stress, *Quantum-well, HgCdTe, Photoluminescence, Uniaxial pressure.

We discuss the use of externally applied pressure for determining the origin of the peaks in absorption spectra (and related spectra) of semiconductor heterostructures. This technique depends on the different effective mass dependences of the various types of heterostructure energy levels involved in absorption transitions, such as electron, heavy-hole, light-hole, exciton, and defect levels, and the dissimilar pressure dependences of the various masses. Measurements of the hydrostatic or uniaxial pressure dependences of the spectral peaks thus distinguish peaks associated with these different types of energy levels. The approach is demonstrated for GaAs/AlGaAs quantum wells and HgTe/HgCdTe superlattices using hydrostatic pressure. We also briefly discuss the use of externally applied uniaxial pressure for distinguishing heavy- and light-hole-related peaks, and using the heavy-hole/light-hole splitting for determining quantitatively the amount of built-in uniaxial strain in the heterostructure layers.

Keywords: *Exchange coupling, *Magnetic multilayers, Reprints, *Scanning electron microscopy, Reflection high energy diffraction, Scanning tunneling microscopy.

In the late 1980's, a number of exciting yet puzzling observations resulted from experiments investigating the coupling between two ferromagnetic layers separated by a nonferromagnetic spacer layer. A pioneering experiment by Grunberg et al. showed that Fe layers separated by a thin Cr spacer aligned with antiparallel magnetization, but with Au as the spacer layer, a parallel alignment occured. The long-range magnetic dipole from each layer would tend to explain antiparallel alignment; small pinholes in the spacer layer would produce parallel alignment. Alternatively, the layers might be coupled through the spacer-layer conduction electrons by the Ruderman-Kittel-Kasuya-Yosida (RKKY) effects. This was expected to produce an oscillation in coupling as the spacer thickness increased, that is an oscillation between parallel and antiparallel alignment. Oscillatory coupling was first observed by Parkin et al. Researchers had also found that, at spacer thickness where antiparallel alignment occured, the Fe/Cr/Fe system can exhibit a giant magnetoresistance (GMR) effect, that is, an anomalously large change in resistance when a magnetic field is applied. The potential technological importance of the GMR effect to magnetic sensing and magnetic information storage added further impetus to the already rapidly growing area of research in magnetic multilayers.

Keywords: *Microscopy, *Scanning, *Seniconductor devices, *Silicon, Dopes, Profiles, Experimental data, Models, Reprints, AFM(Atomic force microscope), SCM(Scanning capacitance microscope).

A scanning capacitance microscope (SCM) for the two-dimensional profiling of dopants in silicon has been implemented by interfacing a commercial atomic force microscope (AFM) with a high densitivity capacitance sensor. The AFM is used to control the position of a conducting tip and measure surface topography, while other electonics are used to control and record a simultaneous measurement of the capacitance-voltage (C-V) response between the tip and a semiconductor. The operation of the SCM has been quantified by acquiring differential capacitance images of a variety of lateral pn-junctions and uniformly doped silicon samples. The shape of the C-V response between the AFM tip and oxidized silicon has been measured. Also, a computer code has been written to solve poisson's equation for the SCM geometry in three dimensions by using the method of collocation of Gaussian points. The purpose of the SCM modeling is to extract the dopant profile from the SCM measurement.

T. J. Udovic, Q. Huang, and J. J. Rush. 1996, 9p.
Pub. in Jnl. of Solid State Chemistry, Article No. 0096, v122 p151-159 1996.

Keywords: *Neutron diffraction, Reprints, *Lanthanum deuteride, Long range order, Metal hydride, Phase transition.

Neutron powder diffraction (NPD) measurements of the rare-earth deuteride LaD2.50 were undertaken between 10 and 430 K. Rietveld refinements indicated that, above approximately 385 K, the LaD2.50 structure is cubic (Fm3m) with deuterium fully occupying the terrahedral (t) interstices of the fcc La lattice and the excess deuterium occupying a portion of the octahedral (o) interstices with full statistical disorder. As the temperature is decreased below approximately 385 K, the LaD2.50 structure undergoes a tetragonal distortion concomitant with the onset of deuterium long-range order (I41amd) in the o sublattice, similar to previous structural results for the light-rare-earth deuterides RD2+x for 0.3 less than x less than 0.5. Fully developed long-range order is established in the vicinity of 200 to 230 K.

Texture Measurement of Sintered Alumina Using the March-Dollase Function.
Final rept.
J. P. Cline, M. D. Vaudin, J. E. Blendell, K. J. Bowman, N. Medendorp, C. A. Handwerker, and R. Jiggets. 1994, 6p.
Pub. in Advances in X-ray Analysis, v37 p473-478 1994.

Keywords: *Alumina, Texture, Reprints, *March-Dollase, *Pole figures, Rietveld refinement, X ray diffraction.

The Rietveld method entails the calculation of a powder diffraction pattern from crystallographic, microstructural and equipment characteristics. These characteristics are related to the form of the pattern through a series of model functions. The difference between an observed and calculated pattern is then minimized by sequentially refining the physical parameters contained within the model functions to obtain an accurate and precise desceiption of the specimen. A powder diffraction pattern from a specimen exhibiting crystallographic texture, or preferred orientation, will display intensity values which differ systematically from those calculated for a specimen of random orientation. This systematic discrepancy can be addressed by incorporating into the Rietveld refinement a model function for sample texture. A successful model for texture will accurately assess the phase abundance and degree of texture from both oriented and randomized specimens. In this study the authors use the March-Dollase model function to characterize texture development in sintered alumina with respect to processing variables and sintering time.

Dielectric Behavior of a Polycarbonate/Polyester Mixture Upon Transesterification.
Final rept.
B. J. Factor, F. I. Mopsik, and C. C. Han. 1996, 3p.
Pub. in Macromolecules, v29 n6 p2318-2320 1996.

Keywords: *Dielectric spectroscopy, Polycarbonates, Polyesters, Reprints, *Transesterfication.

Dielectric relaxation spectroscopy provides a sensitive measure of the local environment surrounding molecular dipoles. In the examination of polymers, it is customary to record the complex dielectric constant e(star)(v)=e'(v)+ie'(v) as a function of frequency v. The form of the spectra can often be related to aspects of specimen structure. For example, the distribution of local environments that arise due to concentration fluctuations in polymer blends and diblock copolymers has been characterized using this technique. Further information concerning the dipolar magnitude as well as local geometric constraints can also be obtained through accurate measurement of the dielectric dispersion magnitude.

Epitaxial Nucleation and Growth of Chemically Derived Ba2YCu3O7-x Thin Films on (001) SrTiO3.
Final rept.
P. C. McIntyre, M. J. Cima, and A. Roshko. 1995, 11p.
Pub. in Jnl. of Applied Physics, v77 n10 p5263-5272 May 95.

Keywords: *Epitaxy, *Nucleation, *Thin films, *YBCO superconductors, Growth, Organometallic compounds, Kinetics, Phase transformations, X rays, Microstructure, Barium oxides, Copper oxides, Yttrium oxides, Reprints.

The nucleation and growth kinetics of epitaxial Ba2YCu3O(7-x) thin films prepared on (001) SrTiO3 by postdeposition annealing of a chemically derived intermediate layer were investigated in specimens quenched from the growth anneal. The films were produced by spin-on deposition of a metal-organic precursor solution at room temperature and ambient pressure, and subsequent postdeposition annealing to form Ba2Ycu3O(7-x) (BYC). Integrated x-ray intensities of reflections from the majority, c-axis-normal epitaxial BYC in the films were analyzed as a function of time at annealing temperature. The linear transformation kinetics suggest the growth process is controlled by molecular processes at the BY/intermediate interface, and is not rate limited by diffusion.

Notion of a xi-Vector and a Stress Tensor for a General Class of Anisotropic Diffuse Interface Models.
A. A. Wheeler, and G. B. McFadden. Apr 96, 29p, NISTIR-5848.
Prepared in cooperation with Southampton Univ. (England). Faculty of Mathematical Studies.

Keywords: *Surface diffusion, *Anistropy, *Interfaces, *Stress tensors, Binary systems(Materials), Phase transitions, Vector analysis, Surface energy, Three dimensional, Phase field models, Gibbs-Thomson equation, Xi vectors.

The authors consider a general class of multiple-order-parameter models which represent the diffuse interface of a first-order phase transition with anisotropic surface energy and kinetics. They show that in the sharp interface limit, it is possible to construct a xi-vector and they derive the three-dimensional form of the Gibbs-Thomson equation. Moreover they develop the notion of a stress tensor for diffuse interface theories and show that it may be used to derive the equilibrium conditions for edges in interfaces as well as multiple functions. The authors also show that when edges form in the special case of a phase-field model, a weak shock forms in which the spatial derivatives of the phase field are not continuous, and they derive the jump conditions.

The National Semiconductor Metrology Program (NSMP) is a NIST-wide effort designed to meet the highest priority measurement needs of the semiconductor industry as expressed by the National Technology Roadmap for Semiconductors and other authoritative industry sources. The NSMP was established in 1994 with a strong focus on mainstream silicon CMOS technology and an ultimate funding goal of $25 million annually. Current annual funding of approximately $11 million supports the 23 internal projects which are summarized in this Project Portfolio booklet.

High-Tc Multilayer Step-Edge Josephson Junctions and SQUIDs.
Final rept.
N. Missert, T. E. Harvey, R. H. Ono, and C. D. Reintsema. 1993, 3p.
Pub. in Applied Physics Letters, v63 n12 p1690-1692 Sep 93.

Keywords: *Josephson junctions, *Yttrium barium copper oxides, *High temperature superconductors, Fabrication, Thin films, Strontium titanates, Neodymium oxides, Gadolinium oxides, Silver, Reprints, Superconducting Quantum Interference Devices, SQUIDS(Superconducting Quantum Interference Devices), Yttrium barium cuprates, SNS junctions.

The authors have developed a reliable process to fabricate high-quality YBa2Cu3O(7-x) (YBCO) superconductor normal metal-superconductor (SNS) step-edge junctions and SQUIDs over YBCO ground planes. These multilevel circuits employ thin films of SrTiO3 and NdGaO3 as the insulating layer between the active device and the ground plane and use Ag as the normal metal in the Josephson junction. The reproducibility and uniformity of the junctions are better than our single-level devices grown directly on step edges cut into single-crystal substrates. Here the critical current variation among junctions on a single wafer is less than a factor of 2. Junctions grown on thin-film step edges of SrTiO3 have critical currents near 2 MA at 4K, while those grown on NdGaO3 step edges have critical currents near 0.5 mA at 4 K.

Keywords: *Gold, *Multicharged ions, *Electron ion collisions, *Ion atom collisions, Electron cyclotron resonance, Excitation, Ion collisions, Ion sources, Ionization, Surfaces, Reprints, *Foreign technology.

The progress report, in addition to describing recent work in the authors' laboratory, highlights the general character and importance of electron collisions with highly-charged ions (HCI) and describes major advances in the field since the previous conference on the subject. Thus, while the authors' principle efforts are currently directed toward investigation of excitation of HCI, there have been very notable advances by others in the areas of ionization and recombination and an attempt is made to put these into context of the field in general. Also, for the first time, significant progress is now being made by others in experimental investigation of elastic scattering electrons from HCI.

Hot-Electron Microcalorimeter for X-ray Detection Using a Superconducting Transition Edge Sensor with Electrothermal Feedback.
Final rept.
K. D. Irwin, G. C. Hilton, J. M. Martinis, and B. Cabrera. 1996, 3p.
Pub. in Nuclear Instruments and Methods in Physics Research A, v370 p177-179 Apr 96.

Keywords: *X-ray detectors, *Superconductivity junctions, *Calorimeters, Electron temperature, Metal films, Hot electrons, Reprints, *Phonon detectors, *Micro calorimeters.

The authors investigate a hot-electron microcalorimeter for X-ray detection. The X-ray absorber consists of a normal metal film in thermal and electrical contact with a superconducting transition-edge sensor. The sensor is formed by a proximity-effect bilayer of aluminum and silver, with a sharp superconducting transition near 100 mK. Energy from X-rays absorbed in the normal film is removed by a reduction of the Joule heating in the proximity bilayer due to electrothermal feedback and measured using a SQUID. The feedback mode of operation allows the measurement of incident energy with no free parameters and should lead to improvement in detector resolution over existing hot-electron microcalorimeters.

Hot-Electron-Microcalorimeters with 0.25 mm(2) Area.
Final rept.
J. M. Martinis. 1996, 2p.
Pub. in Nuclear Instruments and Methods in Physics Research A, v370 p171-172 Apr 96.

Keywords: *X-ray detectors, *Superconducting junctions, *Calorimeters, Reprints, *Microcalorimeters, Phonon detectors.

The author presents measurements on hot-electron microcalorimeter with a normal-insulator superconductor tunnel-junction thermometer that is used for the detection of X-rays. With an absorber area of 0.5 mm by 0.5 mm, pulses of 20- micrometers in duration were observed that gave a 30 eV FWHM resolution for 6 keV X-rays and an 18 eV resolution for heat pulses. This detector has sufficient resolution, detector area, and speed to warrant application in materials analysis.

Magnetic Flux Pinning in Epitaxial YBa2Cu3O7-delta Thin Films.
Final rept.
A. Roshko, L. F. Goodrich, D. A. Rudman, R. Moerman, and L. R. Vale. 1995, 4p.
Pub. in Jnl. of Electronic Materials, v24 n12 p1919-1922 1995.

Keywords: *Flux pinning, *Thin films, Morphology, Dislocations, Microstructures, Reprints, Scanning tunneling microscopy, Nucleation mechanism.

The influence of microstructure on the critical current density of laser ablated YBa2Cu3O7 thin films has been examined. Scanning tunneling microscopy was used to examine the morphologies of YBa2Cu3O7 films and the morphology data were then correlated with measurements of the critical current density. The films were found to grow by an island nucleation and growth mechanism. The critical current densities of the films are similar to those of films with screw dislocation growth, indicating that screw dislocation growth is not necessary for good pinning. The data suggest that the critical current density in applied magnetic field may be higher in films with higher densities of growth features.

Time-Resolved Measurements of the Polarization State of Four-Wave Mixing Signals from GaAs Multiple Quantum Wells.
Final rept.
A. E. Paul, J. A. Bolger, A. L. Smirl, and J. G. Pellegrino. 1996, 10p.
Pub. in Jnl. of the Optical Society of America B, v13 n5 p1016-1025 May 96.

Keywords: *Gallium arsenides, *Aluminum gallium arsenides, *Quantum wells, *Polarization, Optical properties, Excitons, Reprints, Four wave mixing.

The complete polarization state of the degenerate four-wave mixing signal from a GaAs/Al2Ga1-xAs multiple quantum well is determined by time resolution of all four of its Stokes parameters as a function of the relative angle between the two linear input polarizations. The degree of ellipticity and the orientation of the polarization ellipse are both observed to vary dramatically in time, and the temporal evolution is found to be consistent with previous measurements of the time-integrated Stokes parameters and to provide new constraints for physical models. The results are shown to be qualitatively consistent with a phenomenological model requiring the inclusion of both many-body interactions and biexcitonic effects.

Keywords: *Crystallography, *Metals, *Minerals, *Information systems, Alloys, Intermatallic compounds, Numeric data, Crystal structure, Online systems, Searching, Software tools, Database management.

CRYSTMET is a computer-readable database of critically evaluated crystallographic data for metals (including alloys, intermerallics and minerals) accompanied by pertinent chemical, physical and bibliographic information. It currently contains about 60,000 entries and covers the literature exhaustively from 1913. Scientific editing of the abstracted entries, consisting of numerous automated entries, consisting of numerous automated and manual checks, is done to ensure consistency with related, previously published studies, to assign structure types where necessary and to help guarantee the accuracy of the data and related information. Analyses of the entries and their distribution across key journals as a function of time show interesting trends in the complexity of the compounds studied as well as in the elements they contain. Two applications of CRYSTMET are the identification of unknowns and the prediction of properties of materials. CRYSTMET is available either online or via license of a private copy from the Canadian Scientific Numeric Database Service (CAN/SND). The indexed online search and analysis system is easy and economical to use yet fast and powerful. Development of a new system is under way combining the capabilities of ORACLE with the flexibility of a modern interface based on the Netscape browsing tool.

The NIST Crystal and Electron Diffraction Data Center builds a comprehensive database with evaluated chemical, physical, and crystallographic information on all types of well-characterized substances. The data are evaluated and standardized by specially designed computer programs as well as by experts in the field. From its master database, the Data Center produces NIST Crystal Data and an Electron Diffraction Database with over 220,000 and 81,000 entries, respectively. These distribution databases are made available to the scientific community via CD-ROM, scientific community via CD-ROM, scientific instruments and online systems. In addition, the Data Center has developed theory and software that can be used for establishing all types of lattice relationships, for the determination of symmetry, for the identification of unknowns using lattice matching techniques, and for data evaluation.

Keywords: *Crystallography, *Scanning election microscopy, *Microstructure, Crystal structure, Change coupled devices, Detectors, Metals, Welds, BKD(Backscatter Kikuchi diffraction), Backscatter Kikuchi diffraction.

Backscattered electron Kikuchi patterns (BEKP) suitable for crystallographic phase analysis can be collected in the scanning electron microscope (SEM) with a newly developed charge coupled device (CCD) based detector. Crystallographic phase identification using BEKP in the SEM is unique in that it permits high magnification images and BEKP's to be collected from a bulk specimen. The combination of scanning electron microscope (SEM) imaging, BEKP, and energy dispersive x-ray spectrometry holds the promise of a powerful new tool for materials science.

The Crystallographic Information File (CIF) uses the self-defining STAR file structure. This requires the creation of a dictionary of data names and definitions. A basic dictionary of terms needed to describe the crystal structures of small molecules was approved in 1991 and is currently used for the submission of papers to Acta Crystallographica C. A number of extensions to this dictionary are in preparation. By storing the dictionary itself as a STAR file, the definitions and relationships in the CIF dictionary become computer interpretable. This offers many possibilities for the automatic handling of crystallographic information.

Included in Jnl. of Research of the National Institute of Standards and Technology, v101 n3 p347-355 May/ Jun 96.

Keywords: *Crystallography, *Journals, Quality control, Publications, Crystal structure, Error analysis.

Quality control of the papers in its journals is a major concern of the International Union of Crystallography. Recent technology development, not least the emergence of a standard data interchange file format, have facilitated the checking of numerical data in a paper, and its error-free transference to the printed page. Consequently, database holdings derived from IUCr journals will be of greater accuracy. Other publishers of crystallographic data may benefit from these innovations.

Keywords: *Crystallography, *Research projects, *Information systems, *Databases, Crystal structure, Workshops, Abstracts.

The ongoing computer revolution is causing changes in all crystallographic data activities and is blurring distinctions between what have traditional been independent efforts. As computer technology removes barriers in data storage, retrieval, and networking, unprecedented opportunities arise to achive the dream of all crystallographers: easy access to all crystallographic data. One topic stressed was the importance of quality throughout all stages of the data flow including collection, publication, and incorportaion into a database. A second major focus was software tools. Many users emphasized that use and accepatance of crystallographic databases by the general scientific community is directly related to the availability and quality of the search tools. A third theme was related to access and availability of all the information. Among the questions raised were: how data will be made available to the user community, and 'Who will be the power brokers in the future technologies. Issues such as these demonstrate the need among the representatives of the various data activities for future meetings to foster a continuing dialog. In addition, many attendees emphasized the need for much greater cooperation among the data centers, among the journals and the date centers, and among users and the data centers.

Neutron Scattering Study of Antiferromagnetic Order in the Magnetic Superconductors RNi2B2C.
Final rept.
J. W. Lynn, Q. Huang, S. K. Sinha, R. Nagarajan, C. Godart, Z. Hossain, and L. C. Gupta. 1996, 3p.
Pub. in Physica B, v223 and 224 p66-68 1996.

Keywords: *Superconductors, *Neutron scattering, *Magnetic order, Reprints.

Neutron diffraction has been used to investigate the magnetic order and crystallography of RNi2B2C. For R = Dy the magnetic order that develops at 10 K consists of ferromagnetic sheets of spins in the tetragonal a-b plane which are stacked antiferromagnetically along the c-axis. An identical magnetic order is observed for R = Ho at low T, while from approximately 5 K to T(N) approximately equal to 8 K each layer along the c-axis is rotated by 163 degrees to form a spiral state, which strongly couples the magnetic order to the superconductivity. Small a-axis peaks are also observed in a narrow temperature range, but the c-axis-peaks are dominant. In ErNi2B2C(Tc = 11 K) an antiferromagnetic a-axis spin density wave stage develops below T(N) = 6.8 K, which readily coexists with the superconductivity indicating that weak coupling occurs between this type of magnetic state and the superconducting state. There is no evidence of magnetic order for either R = Ce or R = Y.

Results of Capacitance Ratio Measurements for the Single Electron Pump-Capacitor Charging Experiment.
Final rept.
N. M. Zimmerman, A. F. Clark, and E. R. Williams. 1996, 2p.
See also PB96-102157.
Pub. in Conference on Precision Electromagnetic Measurements, Braunschweig, Germany, June 17-20, 1996, p505-506.

Keywords: *Metrology, *Electron tunneling, *Capacitance, Electric bridges, Precision, Ratios, Capacitors, Reprints, *Foreign technology, SET(Single electron tunneling).

The authors report on a metrological application of the single electron tunneling (SET) phenomena: a precise measurement of the ratio of two cryogenic capacitors. The measurement used a superconducting SET electrometer as the null detector for a capacitance bridge. They have achieved a 3-ppm level of imprecision in the measurement of capacitance ratio from 100 to 1000 Hz. They used custom-made cryogenic vacuum-gap capacitors, which have a leakage resistance of no less than 10(19) omega. Further improvements can be made in the attempt to obtain an imprecision of 10(-8) at lower frequencies, sufficient for the metrological measurement of capacitance or the fine-structure constant using an SET pump.

Majority and Minority Electron and Hole Mobilities in Heavily Doped Gallium Aluminum Arsenide.
Final rept.
H. S. Bennett. 1996, 10p.
See also PB91-236968.
Pub. in Jnl. of Applied Physics, v80 n7 p3844-3853 Oct 96.

Keywords: *Gallium arsenides, *Electron mobility, *Hole mobility, Minority carriers, Semiconductor doping, Doped materials, Reprints.

The majority electron and minority hole mobilities were calculated in Gal-yAlyAs for donor densities between 10 to the 16th power and 10 to the 19th power to the minus 3 power. Similarly, the majority hole and minority electron mobilities were calculated for acceptor densities between 10 to the 16th power and 10 to the 20th power to the minus 3 power. The mole fraction of AlAs, y, varies between 0.0 and 0.3 in these calculations. All the important scattering mechanisms have been included. The ionized impurity and carrier-carrier scattering processes were treated with a quantum-mechanical, phase-shift analysis. These calculations are the first to use a phase-shift analysis for minority carriers scattering from majority carriers in ternary compounds such as Gal-yAlyAs. The results are in good agreement with experiment for majority mobilities and predict that at high dopant densities minority mobilities should increase with increasing dopant density for a short range of densities. This effect occurs because of the reduction of plasmon scattering and the removal of carriers from carrier-carrier scattering due to the Pauli exclusion principle.

Vortex Images in Thin Films of YBa2Cu3O(sub 7-x) and Bi2Sr2Ca1Cu2O(sub 8+x) Obtained by Low-Temperature Magnetic Force Microscopy.
Final rept.
C. W. Yuan, Z. Zheng, A. L. deLozanne, J. N. Eckstein, M. Tortonese, and D. A. Rudman. 1996, 4p.
Pub. in Jnl. of Vacuum Science and Technology, v14 n2 p1210-1213 Mar 96.

Keywords: *Microscopy, *Thin films, *Magnetic force microscopy, *Superconductors, High temperature, Vortices, Reprints.

The authors have imaged vortices in superconducting thin films with a low-temperature magnetic force microscope that utilizes microfabricated piezoresistive cantilevers with built-in tips. The films of YBa2Cu3O7-x and Bi2Sr2Ca1Cu2O8+x, are made by laser ablation and molecular beam epitaxy, respectively. The vortices usually appear as round features in the noncontact image with a diameter of about 1 micrometer or slightly less. In some cases the position of the vortices is correlated to defects observed in the topographic image of the same area. The vortices move sometimes, especially after taking a topographic (contact mode) scan.

Xi-Vector Formulation of Anisotropic Phase-Field Models: 3-D Asymptotics.
Final rept.
A. A. Wheeler, and G. B. McFadden. 1996, 15p.
Pub. in European Jnl. of Applied Mathematics, v7 p367-381 1996.

Keywords: *Solidification, Liquids-solid interfaces, Surface energy, Differential geometry, Asymptotic series, Vector analysis, Reprints, *Foreign technology, *Phase field models, Allen-Cahn equation, Gibbs-Thomson equation.

In the paper the authors present a new formulation of a large class of phase-field models, which describe solidification of a pure material and allow for both surface energy an interface kinetic anisotropy, in terms of the Hoffman-Cahn epsilon-vector. The Hoffman-Cahn epsilon-vector has previously been used in the context of sharp interface models, where it provides an elegant tool for the representation and analysis of interfaces with anisotropic surface energy. The authors show that the usual gradient-energy formulations of anisotropic phase-field models are expressed in a natural way in terms of the epsilon-vector when apprpriately interpreted. They use this new formulation of the phase-field equations to provide a concise derivation of the Gibbs-Thomson-Herring equation in the sharp-interface limit in three dimensions.

Application of a Simple Technique for Estimating Errors of Finite-Element Solutions Using a General-Purpose Code.
Final rept.
T. J. Chuang, J. T. Tang, and J. T. Fong. 1990, 11p.
Pub. in Proceedings of Pressure Vessels and Piping Conference, Nashville, TN., June 17-21, 1990, p105-115.

Keywords: *Fracture mechanics, *Error analysis, *Finite element method, *Stress analysis, Glass, Computational grids, Plates, Computerized simulation, Mathematical models, Estimates, Reprints.

A simple error-estimate technique using commercially available general purpose finite element codes to solve a class of engineering problems is presented. The technique is based on the assumption that the class of engineering problems to be solved can be simplified to a new class having known analytical solutions. A two-phase procedure is developed where a series of successively-refined mesh designs with acceptable error estimates for the simplified class of problems is used to guide the finite element modeling of the actual engineering problem. To illustrate the procedure, an application in the preliminary design of a circular glass plate with a center hole, a 3-sector configuration, and reinforcing beams at all edges of the sectors, is reported. Error estimates and rates of convergence for parameters of practical interest are derived from numerical results using a finite element code named ANSYS (versions 4.3A and 4.4) as implemented on a Sun3-110 workstation.

Potential Drop in the Center-Cracked Panel with Asymmetric Crack Extension.
Final rept.
D. T. Read, and M. Pfuff. 1991, 11p.
Sponsored by GKSS - Forschungszentrum Geesthacht G.m.b.H., Hamburg (Germany, F.R.).
Pub. in International Jnl. of Fracture 48, p219-229 1991.

Keywords: *Crack propagation, *Fracture strength, *Electric potential, *Nondestructive tests, Tensile tests, Fracturing, Asymmetry, Panels, Calibration, Reprints, Johnson formula.

The well-known Johnson formula relates the electrical potential drop across a symmetric center crack in a current-carrying tensile panel to the crack length. To allow individual measurement of the crack growth at both ends of such a crack, the potential measured between contact points located on opposite sides and equidistant from the panel center line has been studied. Because this potential must ideally be identically zero for symmetric crack growth, it is termed the asymmetric potential. Its sign and magnitude are related to the direction and extent of asymmetric crack growth. It was found that contact points directly above the ends of the initial symmetric crack provide a signal which is well-suited to the determination of the asymmetry of the crack extension. This information is complementary to the total crack length information obtained using the Johnson formula. Experimental measurements and theoretical results were used to produce calibration formulae relating the asymmetric potential to the asymmetry of the crack dimensions in center-cracked panels.

Algebraic Approximation of Attractors for Galloping Oscillators.
Final rept.
E. Simiu, G. R. Cook, and B. Alibe. 1991, 6p.
Pub. in Jnl. of Sound and Vibration 146, n1 p170-175 1991.

Keywords: *Oscillators, *Structural engineering, *Nonlinear algebraic equations, Oscillations, Numerical analysis, Nonlinear systems, Fluidelasticity, Dynamic structural analysis, Approximations, Analysis(Mathematics), Reprints, *Foias-Teman approximation, *Autonomous galloping oscillators, Attractors, Bilinear operator.

A constructive method for approximating attractors was recently developed by Foias and Temam, who applied it to systems in which the nonlinearity is due to a bilinear operator. The purpose of the note is to test the practical applicability of the method to autonomous galloping oscillators, in which the nonlinearity, is due to seventh degree polynomials. The authors give revised versions of two of the expressions given in the original method. They then compare results obtained by algebraic approximation on the one hand and numerical integration on the other. The authors conclude with an assessment of the limitations of the method as applied to the systems.

Exponentially Rapid Coarsening and Buckling in Coherently Self-Stressed Thin Plates.
Final rept.
J. W. Cahn, and R. Kobayashi. 1995, 14p.
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Acta Metall. Mater. 43, n3 p931-944 1995.

Keywords: *Buckling, *Coarseness, *Nonlinear systems, *Thin plates, Diffusion, Elastic properties, Wetting, Stress analysis, Decomposition, Reprints.

The nonlinear equations that couple diffusion and stress are solved by computation for one-dimensional spinodal decomposition and coarsening in a thin plate. The vicinity of two critical values of the stress parameter are explored. At small values of elastic self-stresses, coarsening changes to exponentially fast from the exponentially slow dynamics expected for one-dimensions in the absence of stress. Coarsening is by rapid thickening of a single layer of a different phase from each of the two plate surfaces, leading to bending of the plate. Even though the diffusion equation is the same for bulk and thin plate and changes type at the coherent spinodal transition, in a thin plate the changes near this transition are gradual; the difference in behavior is due to the boundary conditions. Furthermore elasto-chemical equilibria through this transition are completely continuous. If the elastic term is large compared to the wetting term, surface wetting layers of phase of lower energy are found to disappear late in the coarsening.

Noise Modeling and Reliability of Behavior Prediction for Multi-Stable Hydroelastic Systems.
Final rept.
E. Simiu, and M. Frey. 1992, 6p.
Pub. in Proceedings of the International Conference on Offshore Mechanics and Arctic Eng. (OMAE) (11th), Alberta, Canada, June 7-12, 1992, Safety and Reliability, v2 p39-44.

Keywords: *Oscillators, *Hydroelasticity, Modelling, Noise, Hydrodynamics, Prediction, Behavior, Reprints, *Hydroelastic systems.

This paper reviews results of experiments conducted on a simple multi-stable hydroelastic (galloping) oscillator. These results show that a noise may cause a multi-stable hydroelastic system to exhibit chaotic behavior, and that in some instances such behavior cannot be predicted reliably unless noise effects are carefully accounted for. We then present results of a theoretical investigation of a simple, paradigmatic multi-stable system, the Duffing-Holmes oscillator. The results of this investigation show that for the system being considered, noise promotes the occurance of chaotic behavior associated with Smale horseshoes. This theoretical investigation is the first phase of an effort to develop analytical tools for predicting reliably the potential for chaotic behavior of actual hydroelastic systems such as deep-water compliant platforms.

Pub. in International Conference on Applications of Statistics and Probability (6th), Mexico City, Mexico, June 17-21, 1991, v2 p993-1000.

Keywords: *Chaos, *Diffusion, *Oscillators, Models, Elastic properties, Stability, Stochastic processes, Differential equations, Structural engineering, Hydroelasticity, Reliability, Nonlinear systems, Reprints, *Galloping oscillators, *Fluidelasticity.

According to numerical investigations recently reported in the literature certain types of compliant offshore structures may experience undesirable hydroelastic responses, including chaotic responses. The question arises whether such responses can be predicted reliably by using current fluidelastic models. We addressed this question in the specific case of a paradigmatic, strongly nonlinear hydroelastic oscillator exhibits strongly chaotic behavior. It is then shown that modeling the hydroelastic system as a nonlinear diffusion process helps to improve substantially the reliability of the predictions.

Exits in Multistable Systems Excited by Coin-Toss Square-Wave Dichotomous Noise: A Chaotic Dynamics Approach.
Final rept.
Y. R. Sivathanu, C. Hagwood, and E. Simiu. 1995, 7p.
Pub. in Physical Review E, v52 n5 p4669-4675 Nov 95.

Keywords: *Stochastic processes, *Structural engineering, *Noise, Chaos, Construction, Functions(Mathematics), Functional analysis, Reprints, Melnikov function.

We consider a wide class of multistable systems perturbed by adissipative term and coin-toss square-wave dichotomous noise. These systems behave like their harmonically or quasiperiodically driven counterparts: depending upon the system parameters, the steady-state motion is confined to one well for all time or experiences exits from the wells. This similarity suggests the application to the stochastic systems of a Melnikov approach originally developed for the deterministic case. The noise induces a Melnikov process that may be used to obtain a simple condition guaranteeing the nonoccurrence of exits from a well.

Pub. in Advanced Earth-to-Orbit Propulsion Technology 1994 NASA Conference, Huntsville, AL., May 17-19, 1994, Publication 3282, v1 p105-112.

Keywords: *Flowmeters, Liquid oxygen, Reprints, Water, *Space Shuttle, *Vortex, Vortex shedding.

A vortex shedding flowmeter designed to measure Liquid oxygen flow in the RS007031 duct of the Space Shuttle Main Engine has been built and tested using water and liquid nitrogen (LN2). The best meter performance was obtained with an elbow located a few diameters upstream and the vane axis perpendicular to the plane of the bend rather than with a long straight section upstream of the meter. At either the same flow velocity or the same Reynolds number, the meter performance was better for LN2 than for water. A flowmeter vane of circular cross section has been developed for the 28 mm branch of the RS007032 duct. The performance of these meters approaches that of commercial flowmeters.

Keywords: *Contamination, *Gas pressure, *Instrument errors, *Measuring instruments, *Partial pressure, *Space environment simulation, Calibrating, Vacuum systems, Exposure, Handbooks, Pressure vessels, Quadrupoles, Residual gas, Sensitivity.

For vacuum-system or test-article analysis it is often desirable to know the species and partial pressures of the vacuum gases. Residual gas or Partial Pressure Analyzers (PPA's) are commonly used for this purpose. These are mass spectrometer-type instruments, most commonly employing quadrupole filters. These instruments can be extremely useful, but they should be used with caution. Depending on the instrument design, calibration procedures, and conditions of use, measurements made with these instruments can be accurate to within a few percent, or in error by two or more orders of magnitude. Significant sources of error can include relative gas sensitivities that differ from handbook values by an order of magnitude, changes in sensitivity with pressure by as much as two orders of magnitude, changes in sensitivity with time after exposure to chemically active gases, and the dependence of the sensitivity for one gas on the pressures of other gases. However, for most instruments, these errors can be greatly reduced with proper operating procedures and conditions of use. In this paper, data are presented illustrating performance characteristics for different instruments and gases, operating parameters are recommended to minimize some errors, and calibrations procedures are described that can detect and/or correct other errors.

Ignition and Subsequent Transition to Flame Spread in a Microgravity Environment.
T. Kashiwagi, K. Mcgrattan, and H. Baum. Aug 95, 6p.
In NASA. Lewis Research Center, the 3RD International Microgravity Combustion Workshop p 207-212.

Keywords: *Computerized simulation, *Flame propagation, *Flames, *Flow distribution, *Gravitational effects, *Heat flux, *Ignition, *Microgravity, Extinguishing, Fire prevention, Fires, Three dimensional flow, Time dependence, Two dimensional flow.

The fire safety strategy in a spacecraft is (1) to detect any fire as early as possible, (2) to keep any fire as small as possible, and (3) to extinguish any fire as quickly as possible. This suggests that a material which undergoes a momentary, localized ignition might be tolerable but a material which permits a transition to flame spread would significantly increase the fire hazard. Therefore, it is important to understand how the transition from localized ignition to flame spread occurs and what parameters significantly affect the transition. The fundamental processes involved in ignition and flame spread have been extensively studied, but they have been studied separately. Some of the steady state flame models start from ignition to reach a steady state, but since the objective of such a calculation is to obtain the steady state flame spread rate, the calculation through the transition process is made without high accuracy to save computational time. We have studied the transition from a small localized ignition at the center of a thermally thin paper in a microgravity environment. The configuration for that study was axisymmetric, but more general versions of the numerical scheme have been developed by including the effects of a slow, external flow in both two and three dimensions. By exploiting the non-buoyant nature of the flow, it is possible to achieve resolution of fractions of millimeters for 3D flow domains on the order of 10 centimeters. Because the calculations are time dependent, we can study the evolution of multiple flame fronts originating from a localized ignition source. The interaction of these fronts determines whether or not they will eventually achieve steady state spread. Most flame spread studies in microgravity consider two-dimensional flame spread initiated by ignition at one end of a sample strip with or against a slow external flow. In this configuration there is only one flame front. A more realistic scenario involves separate, oppositely directed fronts in two dimensions, or a continuous, radially directed front in three dimensions. We present here some results of both the two and three dimensional codes.

The NASA/NBS Standard Reference Model for Telerobot Control System Architecture (NASREM) was developed by the National Institute of Standards and Technology (NIST) for the National Aeronautics and Space Administration (NASA) to provide a software control system architecture guideline for use by development contractors charged with building the Flight Telerobot Servicer (FTS) control system as part of the Freedom Space Station project. The original NASREM document describes a conceptual or domain-independent architecture, and suggests the outline of a functional or domain-specific architecture for FTS. This paper presents an overview of the NASREM conceptual architecture and reviews subsequent work at NIST in defining a functional architecture for the servo and primitive levels. This work suggests outlines for software and hardware architecture specifications, and software development environments to complement the NASREM conceptual and functional architectures.

Keywords: *Space Station Freedom, *Manipulators, Automation, Robotics, Robot control, Telerobotics, Reprints, *FTS(Flight Telerobotic Servicer), *Flight Telerobotic Servicer, NASREM(NASA/NIST Standard Reference Model).

The Flight Telerobotic Servicer (FTS) is a two armed manipulator which will be used to build and maintain Space Station Freedom. One of the goals of the project is to be able to upgrade the capabilities of the FTS by incorporating new technology. To achieve this goal the FTS is using the NASA/NIST Standard Reference Model for Telerobot Control System Architecture (NASREM) for its functional architecture. While using NASREM helps integrate new technology into the system, the decisions concerning the precise technology needing development must be addressed. In this paper, an approach to the technological evolution of the FTS will be explored. The approach begins with detailed scripts of representative FTS activities. These scripts are analyzed to determine the generic or common actions performed by the FTS. Then, technological alternatives are described in terms of a decision tree format.

Pub. in Institute of Electrical and Electronics Engineers International Conference on Systems Engineering, Fairborn, OH., August 24-26, 1989, p65-68.

Keywords: *Robots, *Space stations, *Computers, Resource allocation, Robot control, Telerobotics, Manipulators, Computer architecture, Algorithms, Servocontrol, Reprints.

The NASA/NBS Standard Reference Model for Telerobot Control System Architecture (NASREM) has been adapted by NASA for use in the Flight Telerobotic Servicer, a two armed telerobotic manipulator which will build and maintain the Space Station. NASREM provides the paradigm that allows standard interfaces to be defined so that functionally equivalent software and hardware modules can be interchanged. This paper examines the mapping of these logical modules onto a functional computer architecture. Interfaces must be first defined which are capable of supporting the algorithms in the literature. After interface definition, the specific computer architecture for the implementation can be determined. An example is shown mapping the SERVO level of NASREM onto a set of computers utilizing the knowledge of the dominant response time required to aid in the selection process.

AISI 44OC martensitic stainless steel is the material of choice for the high pressure oxygen turbopump (HPOTP) of the space shuttle main engine (SSME). Tests have been done over a range of sliding speeds from 0.5 to 2.0 m/s, initial hertzian stresses from 0.915 to 3.66 GPa, and bulk temperatures from -184 deg. C (liquid oxygen temperature) to 760 deg. C. which cover the variations thought to exist in the HPOTP. Data are presented in the form of contour wear maps to allow a more direct view of the interdependencies of the major tribological variables that can be obtained with wear data presented vs. a single variable. Wear maps are used as a tool to aid in the determination of regions dominated by a given wear mode.

Transition from Localized Ignition to Flame Spread Over a Thin Cellulosic Material in Microgravity.
Final rept.
K. B. McGrattan, K. Nakabe, H. R. Baum, and T. Kashiwagi. 1993, 4p.
Pub. in Eastern States Section of the Combustion Institute Technical Meeting, Princeton, NJ., October 1993, Book of Abstracts, p409-412.

Keywords: *Cellulose, *Fire prevention, *Ignition, Combustion, Flame spread, Reprints, Microgravity.

Ignition and flame spread processes are complicated by strong coupling between chemical reactions and transport processes, not only in the gas phase but also in the condensed phase. In most previous studies, ignition and flame spread were studied separately with the result that there has been little understanding of the transition from ignition to flame spread. In fire safety applications this transition is crucial to determine whether a fire will be limited to a localized, temporary burn or whether it will grow to become a large fire. In order to understand the transition to flame spread, the transient mechanisms of ignition and subsequent spread must be studied. However, there have been no definitive experimental or modeling studies because of the complexity of the buoyancy-induced flow near the heated sample surface. One must solve the full Navier-Stokes equations over an extended region to represent accurately the highly unstable buoyant plume and entrainment of surrounding gas. To avoid the complicated nature of the plume problem under normal gravity, previous detailed radiative ignition models were assumed to be one-dimensional or were applied at a stagnation point. Unfortunately, these models could not be extended to include the transition to flame spread.

Also available as N93-20205 (Order as N93-20178).
Pub. in International Microgravity Combustion Workshop (2nd), Cleveland, OH., September 15-17, 1992, p167-179.

Keywords: *Cellulose, *Fire prevention, *Fires, *Flame propagation, *Ignition, *Reduced gravity, Gravitation, Mathematical models, Buoyancy, Entrainment, Reprints, *Spacecraft construction materials.

Both ignition and flame spread on solid fuels are processes that not only are of considerable scientific interest but that also have important fire safety applications. Both types of processes, ignition and flame spread, are complicated by strong coupling between chemical reactions and transport processes, not only in the gas phase but also in the condensed phase. In most previous studies, ignition and flame spread were to flame spread studied separately with the result that there has been little understanding of the transition from ignition limited to flame spread. In fire safety applications this transistion is crucial to determine whether a fire will be limited to a localized, temporary burn or will transition into a growth mode with a potential to become a large fire. In order to understand this transition, the transient mechanisms of ignition and subsequent flame spread must be studied. However, there have been no definitive experimental or modeling studies, because of the complexity of the flow motion generated by buoyancy near the heated sample surface. One must solve the full Navier-Stokes equations over an extended region to represent accurately the highly unstable buoyant plume and entrainment of surrounding gas from far away.

Ignition and Transition to Flame Spread Over a Thermally Thin Cellulosic Sheet in a Microgravity Environment.
Final rept.
K. Nakabe, K. B. McGrattan, T. Kashiwagi, G. Kushida, H. R. Baum, and H. Yamashita. 1994, 14p.
See also PB96-155809.
Pub. in Combustion and Flame, v98 n4 p361-374 1994.

Keywords: *Cellulose, *Fire prevention, *Ignition, Combustion, Flame spread, Reprints, Microgravity.

An axisymmetric, time-dependent model is developed describing auto-ignition and subsequent transition to flame spread over a thermally-thin cellulosic sheet heated by external radiation in a quiescent microgravity environment. Due to the unique combination of a microgravity environment and low Reynolds number associated with the slow, thermally induced flow, the resulting velocity is taken as a potential flow. A one-step global gas phase oxidaton reaction and three global degradation reactions for the condensed phase are used in the model. A maximum external radiant flux of 5 W/sq. cm (Gaussian distribution) with 21%, 30%, and 50% oxygen concentrations is used in the calculations. The results indicate that autoignition is observed for 30% oxygen concentrations but the transition to the flame spread does not occur. For 50% oxygen the trransition is achieved. A detailed discussion of the transition from ignition to flame spread is given as an aid to understanding this process. Also, a comparison is made between the axisymmetric configuration and a two-dimensional (line source) configuration.

Updated Calculations for Routine Space-Shielding Radiation Dose Estimates: SHIELDOSE-2.
S. M. Seltzer. Dec 94, 59p, NISTIR-5477.
Contract NASA-T9311R
See also PB80-176860. Sponsored by National Aeronautics and Space Administration, Houston, TX. Lyndon B. Johnson Space Center.

Keywords: *Spacecraft shielding, *Radiation dosage, Extraterrestrial radiation, Electron irradiation, Proton irradiation, Bremsstrahlung, Cosmic rays, Aluminum, Graphite, Silicon, Water, Gallium arsenides, Air, Calcium fluorides, Silicon dioxide, Computer programs, Fortran, Graphs(Charts), *SHIELDOSE-2 computer program.

New, more-extensive, depth-dose distributions for electrons, electron-bremsstrahlung, and protons have been calculated, based on improvements in cross-section information since the development of the original SHIELDOSE code. The new database covers incident electron energies from 5 keV to 50 MeV, with the bremsstrahlung tail calculated for depths out to 50 g/sq cm, and incident proton energies from 10 keV to 10 GeV. Effects of nuclear interactions on proton depth-dose distributions in aluminum shields have been estimated, and options are provided to include these approximations in test calculations. In addition to the absorbed dose in aluminum, the dose in small volumes of graphite, Si, air, bone, CaF2, GaAs, LiF, SiO2, tissue or water can be evaluated. The functionality of new code is much the same as the old code; however, the resultant dose estimates as a function of depth in aluminum spacecraft can be somewhat different. Through the use of a companion code based on approximate transformations, results can be extended beyond the dose as a function of depth in plane slabs and at centers of solid spheres to include the dose at off-center points in a solid sphere and at the inner surface of spherical shells.

Frozen Orbits for Satellites Close to an Earth-Like Planet.
Final rept.
S. Coffey, A. Deprit, and E. Deprit. 1994, 36p.
Pub. in Celestial Mechanics and Dynamical Astronomy 59, p37-72 1994.

Keywords: *Artificial satellites, *Satellite orbits, Hamiltonian functions, Inclination, Eccentricity, Mission planning, Space missions, Surveys, Reprints, *Satellite theory.

The authors say that a planet is Earth-like if the coefficient of the second order zonal harmonic dominates all other coefficients in the gravity field. This paper concerns the zonal problem for satellites around the Earth-like planet, all other perturbations excluded. By numerical continuation the authors have discovered three families of frozen orbits in the full zonal problem under consideration; (1) a family of stable equilibria starting from the equatorial plane and tending to the critical inclination; (2) an unstable family arising from the bifurcation at the critical inclination; (3) a stable family also arising from that bifurcation and terminating with a polar orbit. Except in the neighborhood of the critical inclination, orbits in the stable families have very small eccentricities, and are thus well suited for survey missions.

The Earth Observing System (EOS) is an international multi-satellite program in global remote sensing of the Earth. The simultaneous goals of acquiring accurate data over many years and correctly identifying systematic effects depend crucially on: (1) calibrating all instruments against a set of recognized physical standards, (2) carefully characterizing the instruments' performances at the system level, (3) adhering to good measurement practices and established protocols, (4) intercomparing instrument measurements where possible, and (5) establishing traceability for all instruments to the common scale of physical quantities maintained at the national standards laboratories.

A program to establish radiometric traceability between Earth Observing System (EOS) instrument calibration facilities and the National Institute of Standards and Technology (NIST) radiance scale is underway. To ensure the high accuracy required for instruments used in the National Aeronautics and Space Administration's (NASA's) EOS program, the output of the working standards will be compared to the radiance scale maintained at NIST. Plans are in place for NIST to provide similar radiometers for the EOS program: the Visible Transfer Radiometer (VXR), the Short-wave Infrared Transfer Radiometer (SWIXR), and the Thermal-infrared Transfer Radiometer (TXR). This article describes the TXR.

Feasibility of Fire Evacuation by Elevators at FAA Control Towers.
J. H. Klote, B. M. Levin, and N. E. Groner. Aug 94, 112p, NISTIR-5445.
Prepared in cooperation with George Mason Univ., Fairfax, VA. Sponsored by Federal Aviation Administration, Washington, DC. Engineering and Environmental Safety Div.

Keywords: *Airport towers, *Air traffic control, *Fire safety, *Evacuating(Transportation), Elevators(Lifts), US FAA, Feasibility, Emergencies.

Throughout most of the world, warning signs next to elevators indicated they should not be used in fire situations. Because these elevators have not been designed for fire evacuation, they should not be used for fire evacuation. However, the idea of using elevators for fire evacuation has gained considerable attention. The Federal Aviation Administration (FAA) has sponsored a project to study the feasibility of elevator emergency evacuation at air traffic control towers. This paper describes this project including (1) a general discussion of elevator evacuation, (2) presentation of conceptual criteria for such elevator evacuation systems, and (3) application of that criteria to several ATCTs.

Analytical Estimation of Carrier Multipath Bias on GPS Position Measurements.
Technical note.
C. M. Volk, and J. Levine. Apr 94, 67p, NIST/TN-1366.
Also available from Supt. of Docs. as SN003-003-03266-2. Prepared in cooperation with Joint Inst. for Lab. Astrophysics, Boulder, CO.

Keywords: *Global positioning system, *Multipath transmission, *Position finding, Phase measurement, Mathematical models, Error analysis, Degradation, Accuracy, Bias.

Multipath is one of the factors degrading the accuracy of position measurements obtained with the Global Positioning System (GPS). We investigate the effects of multipath on the carrier phase measurements and the resulting bias on relative GPS positions for observation times longer than several hours. We first model the phase error due to multipath from a single plane reflector in terms of satellite reflector geometry. The model is then employed to estimate upper limits of the multipath bias for general receiver environments. We also consider bias due to multipath from the flat ground, from nearby objects and from tilted ground, obtaining formulae for each situation that depend only on reflector characteristics and geometry. We find that the multipath phase error gives rise to vertical biases smaller than 2 mm and horizontal biases smaller than 1 mm if carrier-phase observations are averaged for at least several hours and if some basic precautions are taken regarding the placement of the receiving antenna.

Keywords: *Pipelines, *Storage tanks, *Earthquake resistant structures, Seismic design, Design standards, Building codes, Piping systems, Pipe joints, Welded joints, Dynamic structural analysis, Natural gas distribution systems, Liquefied natural gas, Oil lines, Gas mains, Soil-Structure interactions, Earthquake engineering, Lifeline systems.

The vulnerability of gas and liquid fuel pipeline systems to damage in past earthquakes, as well as available standards and technologies that can protect these facilities against earthquake damage are reviewed. An overview is presented of measures taken by various Federal Agencies to protect pipeline systems under their jurisdiction against earthquake hazards. It is concluded that the overall performance of pipeline systems in past earthquakes was relatively good, however, older pipelines and above-ground storage tanks were damaged in many earthquakes. Standards and regulations for liquid fuel pipelines contain only general references to seismic loads. Standards and regulations for above-ground fuel storage tanks and for liquefied natural gas facilities contain explicit seismic design provisions. It is recommended that a guideline for earthquake resistant design of gas and liquid fuel pipeline systems be prepared for Federal Agencies to ensure a uniform approach to the protection of these systems.

Pub. in Review of Progress in Quantitative Nondestructive Evaluation, Snowmass Village, CO., July 31-August 5, 1994, v14A p951-958 1995.

Keywords: *Nondestructive tests, *Crack detection, Reprints, *Thickness gages, Ultrasonic thickness gages, Gas-coupled, Pulse-echo.

Ultrasonic inspection is a standard method to assess the integrity of large-diameter oil pipelines. However, similar methods applied to natural-gas pipelines present a considerably greater challenge; gas is apoor coupling agent for the probing ultrasonic signals between the transducer and the pipe wall. Natural gas exhibits a very low specific acoustic impedance (300 Rayls for methane at atmospheric pressure) compared to oil (1.5 Mrayls and higher). Consequently, large ultrasonic-signal transmission losses occur at the transducer/gas and pipe-wall/gas interfaces. To circumvent this obstacle, past exploratory developments included the use of a liquid-filled wheel, electromagnetic- acoustic-transducer (EMAT), and liquid-slug technology. While prototypes of high-speed, in-line inspection systems employing such principles do exist, all exhibit serious operational shortcomings that prevent widespread commercial exploitation.

Keywords: *Fire safety, *Trains, *Passengers, Smoke, Fire tests, Evacuating(Transportation), Rapid transit systems.

New alternative technologies have been developed which can be used to increase intercity passenger train operating speeds. These technologies include steel-wheel-on-rail and magnetic levitation (maglev) systems. Fire safety is an area of particular interest for these technologies, as well as for conventional intercity and commuter trains. While the historical fire record has been very good and few serious passenger train fires have occurred, minor incidents could develop into potential life-threatening events. The report presents a detailed comparison of the fire safety approaches used in the United States, France, and Germany. The strengths and weaknesses of current methods for measuring the fire performance of rail transportation systems are evaluated. An optimum systems approach to fire safety which addresses typical passenger train fire scenarios is analyzed and recommendations are presented to address the current state-of-the-art in materials testing.

Ultrasonic Measurement of Residual Stress in Railroad Wheel Rims.
Final rept.
R. E. Schramm, A. V. Clark, and T. J. McGuire. 1992, 5p.
Sponsored by Federal Railroad Administration, Washington, DC.
Pub. in Proceedings of International Wheelset Congress (10th), Sydney, Australia, September 27-October 1, 1992, p151-155.

Keywords: *Nondestructive tests, *Ultrasonic flow detection, *Railroad trucks, *Stress measurement, *Wheels, Acoustic measurement, Accuracy, Signal processing, Ultrasonics, Transducers, Residual stress, Data analysis, Birefringence, Reprints.

This work discusses three possible acoustic measurement techniques to detect and quantify the stress railroad wheel rims. The goal is to develop instrumentation useful for nondestructive testing during field inspection for potentially dangerous conditions. In each case, the application of novel noncontact transducers (EMATs) takes advantage of minimal surface preparation and the elimination of fluid couplants. Each tech-

nique depends on the very precise (one part in 10(exp 4)) timing of signal arrival. Elastic changes caused by stress generate very small, but detectable velocity changes. However, other factors, notably changes in metallurgical texture, will similarly alter the velocity. Initial tests indicate the possibility of determining the size of this texture effect and reducing the uncertainty in measured stress to about 55 MPa or less. This accuracy would allow judgment on the safety of continued operation of a wheel. For one method, a birefringence approach, we have constructed a prototype that is now at a railroad research center. Ultrasonic data collected with this gear correlate well with those from destructive sawcutting for the four wheels we have examined so far. Work on the design and construction of transducers and data analysis continues.

Keywords: *Residual stress, *Ultrasonic tests, *Railroad cars, *Wheels, Nondestructive tests, Transducers, Inspection, Steels, Transportation safety, Detection, Cracks, Defects, Reprints, *Cast steel railroad wheels.

Residual hoop stresses in the rims of railroad wheels may change from compressive to tensile during their lifetime, a potentially hazardous condition that could lead to wheel failure by cracking. The current U.S. regulation calls for the measurement of discoloration in the wheel plate indicating a history of heating that may lead to unsafe stress. Quantitative measurement by ultrasonic methods is an attractive alternative. Stress influences elastic parameters and causes small changes in sound velocity. We did an extensive series of measurements around the circumference of ten cast-steel wheels; two were as-made, while the others received induction heating at three different energy levels to generate stresses similar to those of in-service wheels. Two different ultrasonic instruments gave comparable results. Destructive evaluation of stress in three wheels by sawcutting showed a good correlation between flange-tip opening displacement and the ultrasonic measurements. This suggests a reliable method and a field-usable instrument for quantitative nondestructive inspection. This could contribute to the safety and dependability of freight rail systems, and reduce costs due to failures and the unnecessary replacement of good wheels.

Safety Assessment of Railroad Wheels Through Roll-by Detection of Tread Cracks.
Final rept.
A. V. Clark, R. E. Schramm, S. R. Schaps, and B. J. Filla. 1995, 11p.
Pub. in Proceedings of Society of Photo-Optical Instrumentation Engineers Conference on Nondestructive Evaluation of Aging Railroads, Oakland, CA., June 6-8, 1995, p109-119.

Keywords: *Railroad trucks, *Wheels, *Cracks, *Detection, Defects, Inspection, Rolling stock, Ultrasonic tests, Nondestructive tests, Railroad cars, Reprints, Electromagnetic acoustic transducers.

A prototype system has been developed for roll-by inspection of cracks in the trends of freight car wheels. The system uses noncontacting electromagnetic-acoustic transducers (EMATs) which generate and receive surface waves propagating along the trend surface. If a defect is present it reflects an echo back to the EMAT. The EMAT itself consists of a coil and permanent magnet which are embedded in a 'rocking shoe'. The rocking shoe is suspended by a spring system in a recess machined into the outer surface of a rail plug. When the wheel is centerend over the shoe, it activates a trigger circuit which energizes the EMAT and causes propagation of the surface wave. The detected echoes are analyzed by a microprocessor which characterizes the wheel as being safe or unsafe. The crack detector system has been subjected to field testing using actual locomotive and rolling stock. It has been able to detect both artificial and real defects at roll-by speeds of 25 km/h (15 mph).

Keywords: *Railroad trains, *Nondestructive tests, *Wheels, Rolling stock, Ultrasonic tests, Residual stress, Piezoelectric gages, Thermal stresses.

The effect of stress on elastic parameters causes a small change in sound wave velocity. This acoustoelastic effect is the basis for a method of nondestructive evaluation (NDE). The authors used two types of ultrasonic transducers, piezoelectric and electromagnetic, to measure both thickness-averaged and near-surface stresses in the rims of twenty unused, cast-steel railroad wheels. The manufacturer mounted these wheels on a unique dynamometer and induced thermal damage by dragging tread breaks to simulate in-service conditions that might generate tensile hoop

stress. After the authors' ultrasonic nondestructive tests, they cut eighteen wheels with a saw along a radius to measure flange tip opening and verify the stress state.

This is a key period in the development of electric and hybrid electric vehicles. The landmark 1990 legislation in California requires that 2 percent of new automobiles be zero emission vehicles in 1998, rising to 10 percent in the year 2005. This can only be met by electric vehicles. The purpose of the workshop was to concentrate on the technologies to improve the design, performance, manufacturability, and economics of the critical components for the next generation of electric and hybrid electric vehicles for the year 2000 and beyond. The workshop began with invited speakers to cover the general topics of impact of the California legislation, Federal agency programs, development of standards, infrastructure needs, advanced battery development, and the imperatives for commercial success of electric and hybrid electric vehicles. Working sessions were five parallel meetings on Energy Conversion Systems, Energy Storage Systems, Electric Propulsion Systems, Controls and Instrumentation, and Ancillary Systems.

Recommendations on Selection of Vehicle-to-Roadside Communications Standards for Commercial Vehicle Operations.
H. Scott, K. Stouffer, and P. Rowe. Jun 94, 80p, NISTIR-5444.

Keywords: *Highway communication, *Standards, *Data transmission, *Commercial vehicles, Radio links, Communication systems, Transponders, Communication equipment, Communications networks, Automatic highways, Intelligent Vehicle Highway Systems.

The National Institute of Standards and Technology (NIST) Robot Systems Division is participating in a Federal Highway Administration (FHWA) program that is to lead to the recommendation of standards in Vehicle-to-Roadside Communications (VRC) equipment used in commercial vehicle operations (CVO). There is substantial motivation to develop these standards, both on the part of the government and the CVO community. A standardized VRC system will allow states to check credentials, weight, and safety parameters while commercial vehicles travel at highway speeds of up to 160 km/h. This will improve the current situation in which substantial time and productivity is lost while commercial vehicles stop and wait for inspections. More sophisticated systems may employ weigh-in-motion equipment, on-vehicle sensors to determine brake temperature and other parameters in real-time, and other subsystems (navigation, etc.) capable of generating relevant data. This communications link will serve an important role in passing data between various onboard intelligent control system computers and the roadside systems.

Keywords: *Highway communication, *Commercial vehicles, *Data transmission, Transponders, Standards, Communications networks, Communication systems, Automatic highways, Communication equipment, Radio links, Intelligent Vehicle Highway Systems.

The National Institute of Standards and Technology (NIST) Robot Systems Division is participating in a Federal Highway Administration (FHWA) program that is to lead to the recommendation of standards in Vehicle-to-Roadside Communications (VRC) equipment. A standardized VRC system will allow states to check credentials, weight, and safety parameters while commercial vehicles travel at highway speeds of up to 160 km/h. This will improve the current situation in which substantial time and productivity is lost while commercial vehicles stop and wait for inspections. More sophisticated systems may employ weight-in-motion equipment, on-vehicle sensors to determine brake temperature and other parameters in real-time, and other subsystems (navigation, etc.) capable of generating relevant data. This communications link will serve an important role in passing data between various onboard intelligent control system computers and the roadside systems. Numerous incompatible VRC designs and protocols exist, or are being developed. The deployment of incompatible systems will not result in transparent borders, where a truck can pass, for example, from one state to another without stopping. A standard is to be developed or chosen that will meet current and projected requirements, such as those of the Intelligent Vehicle Highway System (IVHS). NIST interacted with various users, VRC equipment manufacturers, IVHS planners, and other government agencies to determine the current and projected VRC requirements. Fifteen systems and six protocols were examined in this study.

Model Minimum Performance Specifications for Lidar Speed Measurement Devices.
Technical rept. Apr 92-Dec 94 (Final).
J. Worthy, G. Lieberman, and B. Moran. Jan 95, 50p, DOT-HS-808 214.
Prepared in cooperation with National Inst. of Standards and Technology (EEEL), Gaithersburg, MD. Office of Law Enforcement Standards.

Keywords: *Specifications, *Optical radar, *Speed indicators, Speed limit effectiveness, Speed limits, Electronic monitoring systems, Traffic law enforcement, Laser applications, Traffic law violations, Highway safety, Velocity measurement, *LIDAR(Light Detection and Ranging).

This technical report provides an overview of the circumstances leading to a request from the International Association of Chiefs of Police to the National Highway Traffic Safety Administration (NHTSA) for the development of performance specifications for LIDAR (LIght Detection And Ranging) aka Laser, devices used in speed limit enforcement. Chapter I provides an overview and description of the use of lidar speed measurement devices in speed limit enforcement. This chapter also contains NHTSA's recommendations concerning the use of lidar in speed limit enforcement and for the training of law enforcement officers using these devices. Chapter II contains the model minimum performance specifications for the lidar along with the protocol for use in the laboratory and field testing of these devices to determine their compliance with the model performance specifications.

Risk Analysis for the Fire Safety of Airline Passengers.
R. L. Smith. Jun 94, 40p, NISTIR-5441.
Contract DTFA03-92-Z-00018
Sponsored by Federal Aviation Administration Technical Center, Atlantic City, NJ.

Keywords: *Fire safety, *Airlines, Passengers, Aircraft fires, Software, Risk analysis, Decision theory, Water.

The purpose of this report is to describe the National Institute of Standards and Technology's work to date relating to the general methodology being developed for the project Risk Analysis for the Fire Safety of Airline Passengers and the software being used to facilitate this methodology. The approach selected involved the use of influence diagrams. Therefore, a brief discussion of influence diagrams is given. The status of their application to the water mist system for passenger planes is given and the overall approach to carrying out the project is described. An example is included that shows how the process works, but the case is fictional, not intended to be realistic.

See also PB95-162046.
Pub. in Proceedings of International Symposium on Fire Safety Science (4th), Ottawa, Ontario, Canada, June 13-17, 1994, p1007-1016.

Keywords: *Fire safety, *Rail transportation, *Risk assessment, *Transportation safety, Fires, Railroad cars, Test methods, Standards, Burning rate, Smoke, Combustion, Reprints, *Heat release rate.

Recent advances in guided group transportation, fire test methods, and hazard analysis necessitate re-examination of requirements for fire safety. Several studies have indicated nearly random ability of current tests to predict actual fire behavior. A comparison of the approaches used in the United States, Germany, and France is presented. With the strengths and weaknesses of current methods for measuring the fire performance of materials used in rail transit systems reviewed, a direction is suggested in which most fire science-oriented organizations in the world are clearly headed--fire hazard and fire risk assessment methods supported by measurement methods based on heat release rate.

Properties of Working Fluids for Thermoacoustic Refrigerators.
Annual rept. 1 Oct 94-30 Sep 95.
M. R. Moldover, and K. A. Gillis. 1 Aug 95, 108p.
Contract N00014-93-F-0101

Keywords: *Acoustic data, *Refrigerants, *Refrigeration systems, *Thermophysical properties, Computer programs, Density, Temperature, Vapor phases, Gas dynamics, Thermal conductivity, Pressure, Fluids, Helium, Viscosity, Acoustic velocity, Enthalpy, Xenon, Entropy, Prandtl number, Viscometers, *Thermoacoustics, Nobleg computer program.

The objective of this project is to provide thermophysical property data for candidate working

General

fluids in a form suitable for optimizing the design of thermoacoustic refrigerators. The data will be provided in a computer program that calculates the properties of the most promising gas mixtures. This package will consist of currently available data from the literature (provided that it is of sufficient quality) and our own measurements (when insufficient literature data exist). The properties provided are viscosity, thermal conductivity, Prandtl number, density, speed-of-sound, specific heat, enthalpy, and entropy for temperatures between -20 and 30 C and pressures up to 20 bars. We will also explore methods of varying the composition of the working fluid to maintain a constant speed of sound over the operating range of the refrigerator. (MM).

Evaluating Investments in Law Enforcement Equipment: An Annotated Bibliography.
Final rept.
S. F. Weber, B. C. Lippiatt, and K. S. Johnson. 1989, 27p.
Pub. in National Institute of Justice Report 900-89, 27p 1989.

Keywords: *Bibliographies, *Protective equipment, *Police vehicles, *Law enforcement, *Investments, Ammunition, Weapons, Police patrol cars, Operations research, Information systems, Cost benefit analysis, Economic analysis, Reprints, Police equipment.

The report is a guide to the literature and annotated bibliography on evaluating investments in law enforcement equipment. Each entry includes the complete citation, an abstract with key words, and in most cases, information on availability. The search strategy is documented and a subject index and lists of references by author and by subject area are included. The main categories are: (1) evaluation methods; (2) police vehicles; (3) police armament; (4) Automatic Vehicle Monitoring (AVM) systems; and (5) police information systems. All 43 included publications both address economic issues such as costs or benefits and are relevant to current decisions on procuring police equipment. The search focused on three primary sources: (1) the NCJRS (National Criminal Justice Reference Service) database; (2) the Criminal Justice Periodical Index (CJPI); and (3) the NTIS (National Technical Information Service) database.

Exposure: An Expert System Fire Code.
Final rept.
R. L. Smith. 1991, 15p.
Pub. in Fire Technology 27, n2 p145-159 May 91.

Keywords: *Fire codes, *Artificial intelligence, *Building codes, Fire spread, Computer programs, Exposure, Cost effectiveness, Walls, Fire safety, Reprints, *Building fires, *Expert systems, Combustibles.

The report addresses the issue of developing an expert or knowledge-based system that deals with the problem of preventing the spread of fire between buildings. A knowledge-based program, EXPOSURE, has been developed that facilitates using more appropriate technology, expanding the problem domain, and providing cost-effective solutions. EXPOSURE can solve the problem of the prevention of the spread of fire between buildings for the case when the exposed building has combustible walls. The use of the expert system EXPOSURE and NFPA 80A produce significantly different recommended minimum separation between buildings. In one case the separation required by NFPA 80A was more than five times greater than what EXPOSURE recommended. The program demonstrates that significant cost savings in achieving the desired level of fire safety and in assuring the levels of safety can be obtained by use of expert system fire codes.

Forum for International Cooperation on Fire Research.
Final rept.
J. E. Snell. 1993, 9p.
Pub. in Proceedings of Nordic Fire Safety Engineering Symposium, Development and Verification of Tools for Performance Codes, Espoo, Finland, August 30-September 1, 1993, 9p.

Keywords: *Fire research, *International cooperation, *Meetings, Fire safety engineering, Norway, Sweden, Finland, Reprints, *Nordic countries, FORUM research group.

The paper describes the Forum for International Cooperation on Fire Research (FORUM) and its rule in the Nordic Fire Safety Engineering Symposium. The FORUM is an informal group of individuals who direct fire research programs and laboratories. This group shares a common commitment to the advance of fire safety engineering through cooperation in research and its application. The paper suggests actions needed to accelerate the advance of fire safety engineering.

Fresh Look at Strategies for Fire Safety.
Final rept.
J. E. Snell. 1990, 10p.
Pub. in Proceedings of Interflam '90 Conference, Canterbury, England, September 3-6, 1990, p305-314.

Keywords: *Fire research, *Technology innovation, *Fire safety, Cost effectiveness, Fire losses, Fire codes, International cooperation, Reprints, Fire research strategies.

Recently, in the U.S.A., fire deaths and injuries have plateaued (and may even be increasing) and the costs of fire safety to society have been increasing and in most cases well ahead of inflation. The paper presents a preliminary analysis of this situation from the perspective of the potential contribution of fire research. It points to the need for major technical innovations in five areas to provide the basis for legitimizing fire prevention technology, or what we have termed the technologies for assured fire safety. These technologies may complement and strengthen the traditional fire safety strategies, further reducing the losses to fire and the economic burdens of fire on society.

AutoBid 2.0: The Microcomputer System for Police Patrol Vehicle Selection.
S. F. Weber. Feb 96, 12p, NISTIR-5787.
Sponsored by National Inst. of Justice, Washington, DC.

Keywords: *Police patrol cars, *Fleet management, *Acquisition, *Decision support systems, Selection, Ranking, Ratings, Factor analysis, Cost benefit analysis, Performance evaluation, Procurement, Decision making, Optimization, Police vehicles, User manuals(Computer programs), AutoBid computer program, Police equipment, Multiattribute analysis.

This report is the user manual for a microcomputer system designed to help police fleet administrators select the patrol vehicle that is best suited to their needs. The system is called AutoBid and uses vehicle performance test data for police patrol package models published annually by the Michigan State Police. The system offers two vehicle selection methods: performance-based and value-based. Performance selection is based on both vehicle test scores alone. It ranks vehicles by their overall test performance independent of cost. Value selection is based on both vehicle cost and test scores. It identifies which vehicle is the 'Best Buy' in terms of the lowest cost for equivalent test performance and ranks the vehicles by the bid price adjusted for performance. Either or both of these methods may be used for a given fleet acqusition decision.

Supersedes PB86-213089. Also available from Supt. of Docs. as SN003-003-03403-7.

Keywords: *Directories, *Law enforcement, *Organizations, United States, Criminal justice.

This is a directory of organizations that are active in one or more areas of the criminal justice system, including law enforcement, courts, corrections and rehabilitation. The directory lists national organizations primarily, but also includes regional organizations and local organizations of special interest as well as international organizations which have a significant number of American members, a U.S. chapter or subcommit-

tee, or are doing work applicable to law enforcement in this country. The types of national law enforcement and criminal justice organizations listed in this directory are limited by the criterion that they be nonprofit. Included in this category are professional and volunteer social action associations, research centers (usually connected with a university), and government agencies. Strictly social or fraternal organizations are not listed.

Urban Administration & Planning

04,873
FIPS PUB 8-6 PC E09
National Inst. of Standards and Technology (CSL), Gaithersburg, MD.
Metropolitan Areas (Including MSAs, CMSAs, PMASs, and NECMAs). Category: Data Standards and Guidelines; Subcategory: Representations and Codes.
Mar 95, 133p.
Supersedes FIPS PUB 8-5. Also available from Supt. of Docs.

Keywords: *Metropolitan areas, *Geocoding, *Classification, *Geography, Metropolitan statistical areas, Standard Metropolitan Statistical Areas, New England, Cities, Counties, Urban areas, States(United States), Federal Information Processing Standards, Data standards and guidelines, Representation and codes, Consolidated Metropolitan Statistical Areas, Primary Metropolitan Statistical Areas, Data elements.

The standard specifies titles, components, and identification codes for the Metropolitan Areas (MAs) of the United States and Puerto Rico, including units called Metropolitan Statistical Areas (MSAs), Consolidated Metropolitan Statistical Areas (CMSAs), and Primary Metropolitan Statistical Areas (PMSAs), and related units called New England County Metropolitan Areas (NECMAs). The general concept underlying Metropolitan Areas is that of a core are containing a large population nucleus together with adjacent communities having a high degree of economic and social integration with that core. The revision incorporates minor editorial changes and technical changes that have been issued in change notices and supersedes FIPS PUB 8-5 in its entirety.

ALEXEFF, I.

Observations of Partial Discharges in Hexane Under High Magnification.
PB95-163127 *01,900*

ALFASSI, Z. B.

Oxidation of Ferrous and Ferrocyanide Ions by Peroxyl Radicals.
PB97-122402 *01,191*

Temperature Dependence of the Rate Constants for Reaction of Dihalide and Azide Radicals with Inorganic Reductants.
PB95-162756 *00,964*

Temperature Dependence of the Rate Constants for Reaction of Inorganic Radicals with Organic Reductants.
PB94-198280 *00,783*

ALGEO, M. E. A.

Process for Selecting Standard Reference Algorithms for Evaluating Coordinate Measurement Software.
PB94-173754 *02,629*

State-of-the-Art Survey of Methodologies for Representing Manufacturing Process Capabilities.
PB94-187655 *02,812*

ALIBE, B.

Algebraic Approximation of Attractors for Galloping Oscillators.
PB95-162897 *04,820*

Chaotic Motions of Coupled Galloping Oscillators and Their Modeling as Diffusion Progresses.
PB96-122718 *04,823*

Foias-Temam Approximations of Attractors for Galloping Oscillators.
PB94-198298 *04,817*

ALKAN DONMEZ, M.

Real Time Compensation for Tool Form Errors in Turning Using Computer Vision.
PB95-107231 *02,945*

ALLAN, D. W.

Confidence on the Second Difference Estimation of Frequency Drift.
PB95-151460 *01,532*

Precision Oscillators: Dependence of Frequency on Temperature, Humidity and Pressure.
PB94-198306 *02,031*

Smart Clock: A New Time.
PB95-151445 *01,530*

ALLEN, A. J.

Analysis of Small-Angle Scattering Data Dominated by Multiple Scattering for Systems Containing Eccentrically Shaped Particles or Pores.
PB96-160411 *03,075*

Anisotropy of the Surfaces of Pores in Plasma Sprayed Alumina Deposits.
PB96-123211 *03,126*

ALLEN, L. P.

Effect of Anneal Temperature on Si/Buried Oxide Interface Roughness on SIMOX.
PB96-112206 *02,382*

ALLEN, O. E.

Time-Domain Antenna Characterizations.
PB95-152781 *02,003*

ALLEN, R.

Resolution of DNA in the Presence of Mobility Modifying Polar and Nonpolar Compounds by Discontinuous Electrophoresis on Rehydratable Polyacrylamide Gels.
PB95-152799 *00,590*

ALLEN, R. A.

Application of the Modified Voltage-Dividing Potentiometer to Overlay Metrology in a CMOS/Bulk Process.
PB94-181997 *02,302*

Comparisons of Measured Linewidths of Sub-Micrometer Lines Using Optical, Electrical, and SEM Metrologies.
PB95-152807 *02,338*

Electrical Test Structure for Improved Measurement of Feature Placement and Overlay in Integrated Circuit Fabrication Processes.
PB95-164273 *02,355*

Electrical Test Structure for Overlay Metrology Referenced to Absolute Length Standards.
PB95-152278 *02,336*

Electrical Test Structures Replicated in Silicon-on-Insulator Material.
PB97-111827 *02,454*

Enhanced Voltage-Dividing Potentiometer for High-Precision Feature Placement Metrology.
PB96-164025 *02,428*

Hybrid Optical-Electrical Overlay Test Structure.
PB96-204136 *02,450*

Measurement of Patterned Film Linewidth for Interconnect Characterization.
PB96-148168 *02,420*

Microelectronic Test Structures for Feature Placement and Electrical Linewidth Metrology.
PB95-180568 *02,367*

Microelectronic Test Structures for Overlay Metrology.
PB96-164249 *02,430*

New Test Structure for Nanometer-Level Overlay and Feature-Placement Metrology.
PB95-175345 *02,363*

Test Structures for the In-Plane Locations of Projected Features with Nanometer-Level Accuracy Traceable to a Coordinate Measurement System.
PB94-200565 *02,313*

ALLEN, S. M.

Electronic Structure and Phase Equilibria in Ternary Substitutional Alloys.
PB97-119366 *03,378*

ALLGOOD, C.

Hair Analysis for Drugs of Abuse: Evaluation of Analytical Methods, Environmental Issues, and Development of Reference Materials.
PB95-176269 *03,501*

ALLGOOD, C. C.

Interlaboratory Comparison Studies on the Analysis of Hair for Drugs of Abuse.
PB95-176251 *03,500*

International Green Building Conference and Exposition (3rd). Held in San Diego, California on November 17-19, 1996. (Reannouncement with new abstract).
PB97-121826 02,531

Test Procedures for Advanced Insulation Panels.
PB97-111892 00,415

U.S. Green Building Conference, 1994.
PB94-206364 02,519

PERSONAL AUTHOR INDEX

FARABAUGH, E. N.

Lineshape Analysis of the Raman Spectrum of Diamond Films Grown by Hot-Filament and Microwave-Plasma Chemical-Vapor Deposition.
PB95-162392 *03,016*

Structures of Vapor-Deposited Yttria and Zirconia Thin Films.
PB94-216025 *03,041*

Studies of Defects in Diamond Films and Particles by Raman and Luminescence Spectroscopies.
PB95-162400 *03,017*

Surface Roughness Evaluation of Diamond Films Grown on Substrates with a High Density of Nucleation Sites.
PB95-162418 *03,018*

FARAH, O. G.

Framework for National Information Infrastructure Services.
PB95-103719 *02,723*

FARAHANI, M.

New Method for Shielding Electron Beams Used for Head and Neck Cancer Treatment.
PB94-211430 *03,621*

New Surface-Active Comonomer for Adhesive Bonding.
PB96-204052 *03,579*

Polymerization Initiation by N-p-Tolylglycine: Free-Radical Reactions Studied by Pulse and Steady-State Radiolysis.
PB95-180014 *01,269*

FARRELL, J. T.

High-Resolution Infrared Overtone Spectroscopy of ArHF via Nd:YAG/Dye Laser Difference Frequency Generation.
PB94-211448 *00,816*

High-Resolution Infrared Overtone Spectroscopy of N2-HF: Vibrational Red Shifts and Predissociation Rate as a Function of HF Stretching Quanta.
PB96-102298 *01,061*

High-Resolution Infrared Spectroscopy of DF Trimer: A Cyclic Ground State Structure and DF Stretch Induced Intramolecular Vibrational Coupling.
PB95-150678 *00,920*

Pairwise and Nonpairwise Additive Forces in Weakly Bound Complexes: High Resolution Infrared Spectroscopy of ArnDF (n=1,2,3).
PB96-200357 *04,125*

Slit Jet Infrared Spectroscopy of Hydrogen Bonded N2HF Isotopomers: Rotational Rydberg-Klein-Rees Analysis and H/D Dependent Vibrational Predissociation Rates.
PB95-161873 *00,956*

Stabilization and Precise Calibration of a Continuous-Wave Difference Frequency Spectrometer by Use of a Simple Transfer Cavity.
PB95-162350 *04,276*

FARROW, R. F. C.

Combined Low- and High-Angle X-Ray Structural Refinement of a Co/Pt(111) Multilayer Exhibiting Perpendicular Magnetic Anisotropy.
PB94-198355 *04,457*

FARROW, R. L.

Measurement of the Self Broadening of the H2Q(0-5) Raman Transitions from 295 to 1000 K.
PB95-108627 *00,884*

FARVARDIN, N.

Channel Coding for Code Excited Linear Prediction (CELP) Encoded Speech in Mobile Radio Applications.
PB95-143178 *01,475*

FASSETT, J.

Working Conference on Global Growth of Technology: Is America Prepared. Held in Gaithersburg, Maryland on December 7, 1995.
PB96-210059 *00,018*

FASSETT, J. D.

Comparative Strategies for Correction of Interferences in Isotope Dilution Mass Spectrometric Determination of Vanadium.
PB94-185261 *00,531*

Isotopic and Nuclear Analytical Techniques in Biological Systems: A Critical Study. 10. Elemental Isotopic Dilution Analysis with Radioactive and Stable Isotopes (Technical Report).
PB96-164157 *00,696*

Study of Laser Resonance Ionization Mass Spectrometry Using a Glow Discharge Source.
DE94018566 *03,308*

Study of Laser Resonance Ionization Mass Spectrometry Using a Glow Discharge Source.
PB96-123203 *03,360*

Traceability to the Mole: A New Initiative by CIPM.
PB95-180246 *00,605*

FAUST, B.

Interim Testing Artifact (ITA): A Performance Evaluation System for Coordinate Measuring Machines (CMMs). User Manual.
PB95-210589 *02,914*

FAVREAU, J. P.

Federal Implementaion Guideline for Eletronic Data Interchange. ASC X12 003050 Transaction Set 865 Purchase Order Change Acknowledgement/Request - Seller Initiated. Implementation Convention.
PB96-172549 *01,825*

Federal Implementation Guideline for Electronic Data Interchange: ASC X12 003040 Transaction Set 838 Trading Partner Profile (Confirmation of Vendor Registration). Implementation Convention.
PB96-111190 *01,813*

Federal Implementation Guideline for Electronic Data Interchange: ASC X12 003040 Transaction Set 838 Trading Partner Profile (Vendor Registration), Implementation Convention.
PB96-112651 *03,674*

Federal Implementation Guideline for Electronic Data Interchange: ASC X12 003050 Transaction Set 836 Procurement Notices. Implementation Convention.
PB96-178892 *01,827*

Federal Implementation Guideline for Electronic Data Interchange. ASC X12 003050 Transaction Set 840 Request for Quotation. Implementation Convention.
PB96-172531 *01,824*

Federal Implementation Guideline for Electronic Data Interchange. ASC X12 003050 Transaction Set 843 Response to Request for Quotation. Implementation Convention.
PB96-168984 *01,822*

Federal Implementation Guideline for Electronic Data Interchange. ASC X12 003050 Transaction Set 850 Award Instrument. Implementation Convention.
PB96-114913 *01,814*

Federal Implementation Guideline for Electronic Data Interchange. ASC X12 003050 Transaction Set 855 Purchase Order Acknowledgment: Implementation Convention.
PB96-172374 *01,823*

Federal Implementation Guideline for Electronic Data Interchange. ASC X12 003050 Transaction Set 860 Modifications to Award Instrument. Implementation Convention.
PB96-114921 *01,815*

Five Q's (Cues) of the U.S. GOSIP Testing Program.
PB96-175716 *01,826*

Formal Methods in Conformance Testing: Result and Perspectives.
PB95-153029 *01,710*

Formal Multi-Layer Test Methodology and Its Application to OSI.
PB94-172194 *02,718*

Industry/Government Open Systems Specification Testing Framework. Version 1.0.
PB94-219110 *01,809*

ISO/IEC Workshop on Worldwide Recognition of OSI Test Results Regional Progress - North America.
PB94-172202 *02,719*

Lessons from the Establishment of the U.S. GOSIP Testing Program.
PB96-119359 *01,817*

National Voluntary Laboratory Accreditation Program. GOSIP: Government Open Systems Interconnection Profile.
PB95-267993 *01,486*

Open Issues in OSI Protocol Development and Conformance Testing.
PB96-122908 *01,818*

U.S. GOSIP Testing Program.
PB94-211455 *01,807*

FAWZY, W. M.

P-Type Doubling in the Infrared Spectrum of NO-HF.
PB94-211463 *00,817*

FAZIO, K.

Thermodynamics of Enzyme-Catalyzed Reactions: Part 1. Oxidoreductases.
PB94-162252 *00,737*

FEDOR, L. S.

Dual-Frequency Millimeter-Wave Radiometer Antenna for Airborne Remote Sensing of Atmosphere and Ocean.
PB96-112289 *02,009*

Dual Frequency mm-Wave Radiometer Antenna for Airborne Remote Sensing of Atmosphere and Ocean.
PB95-180378 *02,006*

FEENEY, A. B.

APDE Demonstration System Architecture. National PDES Testbed Report Series.
PB94-154325 *02,767*

Challenges to the National Information Infrastructure: The Barriers to Product Data Sharing. National PDES Testbed Report Series.
PB95-136347 *02,776*

Guidelines for the Development of Mapping Tables.

Issues and Recommendations for a STEP Application Protocol Framework. National PDES Testbed.
PB94-160868 *02,770*

FEINSTEIN, J.

Higher-Order Approximations in Ionospheric Wave-Propagation.
AD-A292 471/0 *04,420*

FELCHER, G. P.

Neutron Scattering Studies of Surfaces and Interfaces.
PB94-216207 *04,517*

FELDER, R. J.

Increased Pinning Energies and Critical Current Densities in Heavy-Ion-Irradiated Bi2Sr2CaCu2O8 Single Crystals.
PB95-175352 *04,654*

FELDMAN, A.

Analysis of Thermal Wave Propagation in Diamond Films.
PB94-211471 *03,014*

Applications of Diamond Films and Related Materials: International Conference (3rd). Held in Gaithersburg, Maryland on August 21-24, 1995. Supplement to NIST Special Publication 885.
PB95-256053 *03,063*

Lineshape Analysis of the Raman Spectrum of Diamond Films Grown by Hot-Filament and Microwave-Plasma Chemical-Vapor Deposition.
PB95-162392 *03,016*

Proceedings of the Applied Diamond Conference 1995: Applications of Diamond Films and Related Materials International Conference (3rd). Held in Gaithersburg, Maryland, on August 21-24, 1995.
PB95-255204 *04,701*

Structures of Vapor-Deposited Yttria and Zirconia Thin Films.
PB94-216025 *03,041*

Studies of Defects in Diamond Films and Particles by Raman and Luminescence Spectroscopies.
PB95-162400 *03,017*

Surface Roughness Evaluation of Diamond Films Grown on Substrates with a High Density of Nucleation Sites.
PB95-162418 *03,018*

Thermal Wave Propagation in Diamond Films.
PB94-211489 *03,015*

Workshop on Characterizing Diamond Films (3rd). Held in Gaithersburg, Maryland on February 23-24, 1994.
PB94-187663 *04,456*

Workshop on Characterizing Diamond Films (4th). Held in Gaithersburg, Maryland on March 4-5, 1996.
PB96-183090 *04,786*

FELDMAN, U.

Magnetic Dipole Line from U LXXI Ground-Term Levels Predicted at 3200 Angstroms.
PB94-211497 *04,407*

Observation and Visible and uv Magnetic Dipole Transitions in Highly Charged Xenon and Barium.
PB96-138441 *04,056*

FELL, N. F.

Embossable Grating Couplers for Planar Waveguide Optical Sensors.
PB96-190277 *00,641*

FELLER, I.

Learning to Change: Opportunities to Improve the Performance of Smaller Manufacturers.
PB94-166212 *00,010*

FELTON, C. M.

High Spectral Purity X-Band Source.
PB95-163713 *02,045*

FENG, D.

dc Method for the Absolute Determination of Conductivities of the Primary Standard KCl Solutions from 0C to 50C.
PB94-219342 *02,644*

FENG, L.

Addition of M and L-Series Lines to NIST Algorithm for Calculation of X-Ray Tube Output Spectral Distributions.
PB95-108742 *00,569*

FENG, S. C.

Dimensional Inspection Planning Based on Product Data Standards.
PB95-175451 *02,910*

Machining Process Planning Activity Model for Systems Integration.
PB96-165428 *02,841*

U.S. Navy Coordinate Measuring Machines: A Study of Needs.
PB94-162831 *02,807*

FENG, Y.

Compatibilization of Polymer Blends by Complexation. 2. Kinetics of Interfacial Mixing.
PB97-111900 *01,295*

Structural Stabilization of Phase Separating PC/Polyester Blends through Interfacial Modification by Transesterification Reaction.
PB95-150454 *01,239*

FENGHOUR, A.

Viscosity of Ammonia.
PB96-145933 *01,117*

FENIMORE, C.

Can Displays Deliver a Full Measure: Manufacturing.
PB96-111935 *02,185*

Digital Techniques in HV Tests - Summary of 1989 Panel Session.
PB94-216702 *02,035*

Distributions of Measurement Error for Three-Axis Magnetic Field Meters during Measurements Near Appliances.
PB96-180153 *02,110*

Making Displays Deliver a Full Measure.
PB96-122411 *01,490*

National Information Infrastructure and Advanced Digital Video.
PB96-119367 *01,488*

Nonlinear Color Transformations in Real Time Using a Video Supercomputer.
PB96-123021 *02,191*

Observations of Partial Discharges in Hexane Under High Magnification.
PB95-163127 01,900

Report on the Workshop on Advanced Digital Video in the National Information Infrastructure. Held in Washington, D.C. on May 10-11, 1994.
PB95-103677 01,472

Summary Report on the Workshop on Advanced Digital Video in the National Information Infrastructure.
PB96-141320 01,497

Three-Axis Coil Probe Dimensions and Uncertainties during Measurement of Magnetic Fields from Appliances.
PB94-219359 01,885

FERAUDY, D.

Preliminary Comparison of Time Transfers via LASSO, GPS and Two-Way Satellite.
PB95-151098 01,529

FEREK, R. J.

Smoke Plume Trajectory from In situ Burning of Crude Oil: Field Experiments.
PB96-200993 02,597

FERNANDES, G.

Comparison of POSIX Open System Environment (OSE) and Open Distributed Processing (ODP) Reference Models.

Concept Paper: An Overview of the Proposed Trust Technology Assessment Program.
PB96-160882 *01,614*

Guidance to Federal Agencies on the Use of Trusted Systems.
PB95-163440 *01,597*

FLAITZ, C. M.

Diagnosis and Treatment of an Oral Base-Metal Contact Lesion Following Negative Dermatologic Patch Tests.
PB95-180626 *00,172*

FLAMBAUM, V. V.

Fine Structure of Negative Ions of Alkaline-Earth-Metal Atoms.
PB94-211182 *03,837*

Hole Dispersion and Enhancement of Antiferromagnetic Interaction of Localized Spins in High-Tc Superconductors.
PB95-202602 *04,694*

Long-Range Parity-Nonconserving Interaction.
PB95-202594 *03,986*

FLANIGAN, L.

In-Space Welding: Visions and Realities.
PB95-163234 *04,830*

FLATER, D.

Coping with Different Retrieval Methods in Next Generation Networks.
PB95-168555 *02,726*

FLAUD, J. M.

Reanalysis of the (010), (020), (100), and (001) Rotational Levels of (32)S(16)O2.
PB95-125621 *00,887*

FLEISCHMANN, C. M.

Backdraft Phenomena.
PB94-193927 *01,366*

FLEMING, R. F.

Dead Time, Pileup, and Accurate Gamma-Ray Spectrometry.
PB96-167101 *00,697*

FLEMING, T.

First Results from a Coordinated ROSAT, IUE, and VLA Study of RS CVn Systems.
PB94-213477 *00,069*

FLEMING, T. A.

Riass Coronathon: Joint X-ray and Ultraviolet Observations of Normal F-K Stars.
PB96-200217 *00,109*

ROSAT All-Sky Survey of Active Binary Coronae. 1. Quiescent Fluxes for the RS Canum Venaticorum Systems.
PB95-202479 *00,077*

ROSAT All-Sky Survey of Active Binary Coronae. 2. Coronal Temperatures of the RS Canum Venaticorum Systems.
PB94-199601 *00,055*

FLETCHER, R. A.

Complementary Molecular Information on Phthalocyanine Compounds Derived from Laser Microprobe Mass Spectrometry and Micro-Raman Spectroscopy.
PB94-172269 *00,757*

Generation and Characterization of Acetylene Smokes.
PB94-200292 *01,372*

Measurement of the Uniformity of Particle Deposition of Filter Cassette Sampling in a Low Velocity Wind Tunnel.
PB95-163754 *02,549*

Ultrafine Combustion Aerosol Generator.
PB94-200300 *01,373*

FLICEK, P. R.

Core Potentials for Quasi-One-Electron Systems.
PB95-202214 *03,970*

FLIK, M. I.

Thermal Isolation of High-Temperature Superconducting Thin Films Using Silicon Wafer Bonding and Micromachining.
PB96-135017 *02,408*

FLORKOWSKI, D. R.

Four Years of Monitoring alpha Orionis with the VLA: Where Have All the Flares Gone.
PB94-185212 *00,048*

FLORSCH, N.

Calibration of a Superconducting Gravimeter Using Absolute Gravity Measurements.
PB95-202651 *03,684*

FLORUSSE, L. J.

Principle of Congruence and Its Application to Compressible States.
PB96-102892 *01,068*

FLOWERS, G.

Inexpensive Laser Cooling and Trapping Experiment for Undergraduate Laboratories.
PB96-140371 *04,353*

FLOYD, F. L.

Methodologies for Predicting the Service Lives of Coating Systems.
PB95-146387 *03,124*

FLUCK, E.

Inorganic Crystal Structure Database (ICSD) and Standardized Data and Crystal Chemical Characterization of Inorganic Structure Types (TYPIX): Two Tools for Inorganic Chemists and Crystallographers.
PB97-109037 *00,648*

FLURY, B. D.

Representing a Large Collection of Curves: A Case for Principal Points.
PB95-152286 *03,438*

FLYNN, C. P.

Diffraction of Neutron Standing Waves in Thin Films with Resonance Enhancement.
PB97-113278 *04,164*

Enhanced Curie Temperatures and Magnetoelastic Domains in Dy/Lu Super Lattices and Films.
PB94-172665 *04,443*

Magnetic Rare Earth Artificial Metallic Superlattices.
PB95-162293 *04,611*

Magnetoelasticity in Rare-Earth Multilayers and Films.
PB94-211356 *04,495*

FLYNN, G. W.

Silicon Surface Chemistry by IR Spectroscopy in the Mid- to Far-IR Region: H2O and Ethanol on Si(100).
PB96-138565 *01,097*

FLYNN, K. M.

Localization Model of Rubber Elasticity: Comparison with Torsional Data for Natural Rubber Networks in the Dry State.
PB95-107033 *03,195*

FLYNN, T. M.

Bibliography of the Physical Equilibria and Related Properties of Some Cryogenic Systems.
AD-A281 167/7 *03,769*

Compilation of the Physical Equilibria and Related Properties of the Hydrogen-Carbon Monoxide System.
AD-A286 603/6 *00,716*

FOECKE, T.

Fracture Testing of Large-Scale Thin-Sheet Aluminum Alloy.
AD-A306 625/5 *03,305*

Fracture Testing of Large-Scale Thin-Sheet Aluminum Alloy.
PB95-242368 *00,024*

FOEST, R.

Optical and Mass Spectrometric Investigations of Ions and Neutral Species in SF6 Radio-Frequency Discharges.
PB97-111918 *01,985*

FOGLE, W. E.

Development of a Temperature Scale below 0.5 K.
PB95-125639 *03,879*

Systematic Studies of the Effect of a Bandpass Filter on a Josephson-Junction Noise Thermometer.
PB95-162970 *03,939*

Systematic Studies of the Effect of a Post-Detection Filter on a Josephson-Junction Noise Thermometer.
PB95-162988 *03,940*

FOKSINSKI, M.

DNA Base Damage in Lymphocytes of Cancer Patients Undergoing Radiation Therapy.
PB97-122444 *03,643*

FOLDEAKI, M.

Asymmetry between Flux Penetration and Flux Expulsion in Tl-2212 Superconductors.
PB95-125647 *04,527*

Enhanced Flux Pinning via Chemical Substitution in Bulk Superconducting T1-2212.
PB95-169033 *04,647*

Magnetic Susceptibility of Pr2-xCexCuO4 Monocrystals and Polycrystals.
PB95-180253 *04,677*

FOLEY, G. M.

High-Speed Spatial Scanning Pyrometer.
PB94-200003 *02,636*

FOLEY, J. T.

Theoretical Analysis of the Coherence-Induced Spectral Shift Experiments of Kandpal, Vaishya, and Joshi.
PB94-219383 *00,561*

FOLEY, R. P.

Prediction of Strengthening Due to V Additions in Direct-Cooled Ferrite-Pearlite Forging Steels.
PB96-190251 *03,220*

Prediction of the Strength Properties for Plain-Carbon and Vanadium Micro-Alloyed Ferrite-Pearlite Steel.
PB96-123393 *03,216*

FOLMAR, L. C.

Histopathology, Blood Chemistry, and Physiological Status of Normal and Moribund Striped Bass ('Morone saxatilis') Involved in Summer Mortality ('Die-Off') in the Sacramento-San Joaquin Delta of California.
PB94-198157 *00,034*

FONER, S.

Effect of Microstructure on Phase Formation in the Reaction of Nb/Al Multilayer Thin Films.
PB95-168415 *03,352*

First Phase Formation Kinetics in the Reaction of Nb/Al.
PB95-168456 *03,353*

Thin Film Reaction Kinetics of Niobium/Aluminum Multilayers.
PB95-175295 *04,651*

FONG, E.

Interoperability Experiments with CORBA and Persistent Object Base Systems.
PB96-183140 *01,772*

Preliminary Functional Specifications of a Prototype Electronic Research Notebook for NIST.
PB94-207750 *00,012*

Report on Application Integration Architectures (AIA) Workshop. Held in Dallas, Texas on February 8-12, 1993.
PB94-142536 *01,803*

FONG, E. N.

Application of Expert System to Select Data Sources from Chemical Information Databases.
PB95-125654 *00,505*

Persistent Object Base System Testing and Evaluation.
PB95-220588 *01,730*

FONG, J. T.

Application of a Simple Technique for Estimating Errors of Finite-Element Solutions Using a General-Purpose Code.
PB94-200250 *04,818*

Non-Equilibrium Thermodynamic Theory of Viscoplastic Materials.
PB94-198868 *04,467*

Nonequilibrium Thermodynamic Theory of Viscoplastic Materials.
PB96-111661 *04,034*

PC-Based Prototype Expert System for Data Management and Analysis of Creep and Fatigue of Selected Materials at Elevated Temperatures.
PB94-172251 *03,202*

FOOTE, P. D.

Technologic Papers of the Bureau of Standards: Number 170. Pyrometric Practice.
AD-A279 282/8 *03,766*

FORAND, J. L.

Merged-Beams Energy-Loss Technique for Electron-Ion Excitation: Absolute Total Cross Sections for O(5+) (2s yields 2p).
PB96-102058 *04,017*

FORMAN, P. R.

Polarization Dependence of Response Functions in 3x3 Sagnac Optical Fiber Current Sensors.
PB95-162426 *02,154*

Polarization Dependence of Response Functions in 3x3 Sagnac Optical Fiber Current Sensors.
PB96-122684 *02,189*

FORNEY, D.

Infrared and Near-Infrared Spectra of HCC and DCC Trapped in Solid Neon.
AD-A295 578/9 *03,773*

Mid- and Near-Infrared Spectra of Water and Water Dimer Isolated in Solid Neon.
PB95-125662 *00,888*

Vibrational Spectra of Molecular Ions Isolated in Solid Neon: HCCH+ and HCC-. (Reannouncement with New Availability Information).
AD-A253 551/6 *00,707*

Vibrational Spectra of Molecular Ions Isolated in Solid Neon. X. H2O(+), HDO(+), and D2O(+).
PB95-125670 *00,889*

Vibrational Spectra of Molecular Ions Isolated in Solid Neon. XI. NO2(+), NO2(-), and NO3(-).
PB95-125688 *00,890*

Vibrational Spectra of Molecular Ions Isolated in Solid Neon. 11. NO2(+), NO2(-), and NO3(-).
AD-A275 828/2 *00,708*

FORNEY, G. P.

Analyzing and Exploiting Numerical Characteristics of Zone Fire Models.
PB96-102314 *01,400*

Computing Radiative Heat Transfer Occurring in a Zone Fire Model.
PB96-102306 *01,399*

Computing the Effect of Sprinkler Sprays on Fire Induced Gas Flow.
PB96-147111 *00,404*

Field Modeling: Simulating the Effect of Sloped Beamed Ceilings on Detector and Sprinkler Response.
PB96-122866 *01,406*

Improvement in Predicting Smoke Movement in Compartmented Structures.
PB94-172418 *00,332*

Pressure Equations in Zone-Fire Modeling.
PB96-102967 *00,208*

FORTUNKO, C.

Artificial Crack in Steel: An Ultrasonic-Resonance-Spectroscopy and Modeling Study.
PB96-141395 *03,241*

Compressibility of Polycrystal and Monocrystal Copper: Acoustic-Resonance Spectroscopy.
PB96-164223 *02,990*

Elastic Constants and Internal Friction of Polycrystalline Copper.
PB96-141015 *03,364*

Orthotropic Elastic Constants of a Boron-Aluminum Fiber-Reinforced Composite: An Acoustic-Resonance-Spectroscopy Study.
PB96-200175 *03,182*

Ultrasonic-Resonance Spectroscopy of Bulk and Layered Solids.
PB96-141338 *04,759*

FORTUNKO, C. M.

Absorption of Sound in Gases between 10 and 25 MHz: Argon.
PB94-199015 *04,183*

Absorption of Ultrasonic Waves in Air at High Frequencies (10-20 MHz).
PB94-199007 *04,182*

Appropriate Ultrasonic System Components for NDE of Thick Polymer Composites.
PB95-125696 *03,148*

Assessment of Technology for Detection of Stress Corrosion Cracking in Gas Pipelines. Final Report, July 1993-March 1994.
PB94-206646 *02,475*

Determination of Sheet Steel Formability Using Wide Band Electromagnetic-Acoustic Transducers.
PB96-186036 *02,279*

Examination of Objects Made of Wood Using Air-Coupled Ultrasound.
PB95-125712 *03,404*

Gas-Coupled, Pulse-Echo Ultrasonic Crack Detection and Thickness Gaging.
PB96-147129 *04,847*

Hemispherical Test Fixture for Measuring the Wavefields Generated in an Anisotropic Solid.
PB96-190087 *03,181*

High-Sensitivity Acoustic Emission Sensor/Preamplifier Subsystems.
PB95-125704 *02,900*

Selection of Appropriate Ultrasonic System Components for NDE of Thick Polymer-Composites.
PB94-185279 *03,133*

Well-Shielded EMAT for On-Line Ultrasonic Monitoring of GMA Welding.
PB96-186077 *02,879*

FOSSUM, B. M.

Learning to Change: Opportunities to Improve the Performance of Smaller Manufacturers.

ZWINKELS, J.

Comparison of Regular Transmittance Scales of Four National Standardizing Laboratories.
PB94-211232 04,233

ZYWOCINSKI, A.

Thermodynamics of (Germanium + Selenium): A Review and Critical Assessment.
PB97-112536 01,182

KEYWORD INDEX

SAMPLE ENTRY

FIRE DETECTORS
Performance Parameters of Fire Detection Systems
PB94-194339 *00,123*

Keyword term
Title
NTIS order number *Abstract number*

1,1,1,2,3,3-HEXAFLUOROPROPANE
Dielectric Studies of Fluids with Reentrant Resonators.
PB95-153730 *00,952*

1,1,1,2-TETRAFLUOROETHANE
Viscosity of the Saturated Liquid Phase of Six Halogenated Compounds and Three Mixtures.
PB95-162368 *00,960*

Thermodynamic Properties of R134a(1,1,1,2-Tetrafluoroethane).
PB95-168704 *00,988*

Measurements of Molar Heat Capacity at Constant Volume (Cv) for 1,1,1,2-Tetrafluoroethane (R134a).
PB95-168878 *03,264*

Vapour Pressure Measurements on 1,1,1,2-Tetrafluoroethane (R134a) from 180 to 350 K.
PB95-168886 *03,265*

1,3-BUTADIENE
Stability/Instability of Gas Mixtures Containing 1,3-Butadiene in Treated Aluminum Gas Cylinders.
PB95-162285 *02,546*

1-CHLORO-1
Polarized Transient Hot Wire Thermal Conductivity Measurements.
PB95-108817 *00,886*

1-CHLORO-1,2,2,2-TETRAFLUOROETHANE
Viscosity of the Saturated Liquid Phase of Six Halogenated Compounds and Three Mixtures.
PB95-162368 *00,960*

10-METHYLACRIDAN
Oxidation of 10-Methylacridan, a Synthetic Analogue of NADH and Deprotonation of Its Cation Radical. Convergent Application of Laser Flash Photolysis and Direct and Redox Catalyzed Electrochemistry to the Kinetics of Deprotonation of the Cation Radical.
PB94-198371 *00,785*

2-DIFLUOROMETHOXY-1,1,1-TRIFLUOROETHANE
Viscosity of the Saturated Liquid Phase of Six Halogenated Compounds and Three Mixtures.
PB95-162368 *00,960*

2-METHYLPROPENE
Mechanism and Rate Constants for the Reactions of Hydrogen Atoms with Isobutene at High Temperatures.
PB95-151064 *00,929*

2D ARRAYS
SUSAN: SUperconducting Systems ANalysis by Low Temperature Scanning Electron Microscopy (LTSEM).
PB96-112065 *04,728*

High-Frequency Oscillators Using Phase-Locked Arrays of Josephson Junctions.
PB96-135157 *02,080*

3-QUINUCLIDINOL
Determination of 3-Quinuclidinyl Benzilate (Qnb) and Its Major Metabolites in Urine by Isotope Dilution Gas Chromatography Mass Spectrometry.
PB94-199379 *03,492*

3C 273 RADIO SOURCE
Observations of 3C 273 with the Goddard High Resolution Spectrograph on the Hubble Space Telescope.
PB95-202321 *00,076*

A STARS
A-type and Chemically Peculiar Stars.
PB96-123286 *00,101*

Radio and X-ray Emissions from Chemically Peculiar B- and A-Type Stars: Observations and a Model.
PB96-123302 *00,103*

AAMACS SYSTEM
Advanced Angle Metrology System.
PB94-211364 *02,637*

AB INITIO CALCULATION
Ab initio Calculations for Helium: A Standard for Transport Property Measurements.
PB96-102041 *01,060*

ABRASION
Abrasive Wear by Diesel Engine Coal-Fuel and Related Particles.
PB95-104915 *01,450*

ABRIKOSOV VORTICES
Thermally Activated Hopping of a Single Abrikosov Vortex.
PB95-140810 *04,548*

ABSOLUTE GRAVITY
Intracomparison Tests of the FG5 Absolute Gravity Meters.
PB96-102991 *03,688*

ABSOLUTE SPECTRAL RESPONSE
NIST High Accuracy Scale for Absolute Spectral Response from 406 nm to 920 nm.
PB96-179122 *01,865*

Developing Quality System Documentation Based on ANSI/NCSL Z540-1-1994: The Optical Technology Division's Effort.
PB96-202122 *01,869*

ABSORBATES
Ultrafast Time-Resolved Infrared Probing of Energy Transfer at Surfaces.
PB96-123443 *00,620*

ABSORBED DOSE
Problem of Convection in the Water Absorbed Dose Calorimeter.
PB97-110159 *03,523*

ABSORBERS (EQUIPMENT)
Low-Frequency Model for Radio-Frequency Absorbers.
PB95-261939 *04,424*

ABSORBERS (MATERIALS)
Bistatic Scattering of Absorbing Materials from 30 to 1000 MHz.
PB95-150934 *01,891*

ABSORPTANCE
Optical Performance of Commercial Windows.
PB95-208757 *00,392*

ABSORPTION
NIR-Spectroscopic Investigation of Water Sorption Characteristics of Dental Resins and Composites.
PB95-151171 *00,189*

Energy Dependences of Absorption in Beryllium Windows and Argon Gas.
PB96-102124 *04,020*

ABSORPTION CROSS SECTIONS
Scaling of the Nonlinear Optical Cross Sections of GaAs-AlGaAs Multiple Quantum-Well Hetero n-i-p-i's.
PB96-102793 *02,183*

Temperature Dependence of the Gas and Liquid Phase Ultraviolet Absorption Cross Sections of HCFC-123 (CF3CHCl2) and HCFC-142b (CH3CF2Cl).
PB96-201033 *03,298*

Temperature Dependent Ultraviolet Absorption Cross Sections of Propylene, Methylacetylene and Vinylacetylene.
PB96-204177 *01,169*

ABSORPTION SPECTRA
Memory Function Approach to the Shape of Pressure Broadened Molecular Bands.
PB95-152930 *00,944*

Intermediate Coupling in L2-L3 Core Excitons of MgO, Al2O3, and SiO2.
PB96-158043 04,079

ABSORPTION SPECTROMETRY
Spectral Interference in the Determination of Arsenic in High-Purity Lead and Lead-Base Alloys Using Electrothermal Atomic Absorption Spectrometry and Zeeman-Effect Background Correction.
PB96-112099 00,614

ABSORPTION SPECTROSCOPY
Application of a Novel Slurry Furnace AAS Protocol for Rapid Assessment of Lead Environmental Contamination.
PB96-112354 02,526

ABSORPTIVITY
Molar Absorptivities of Bilirubin (NIST SRM 916A) and Its Neutral and Alkaline Azopigments.
PB94-211042 03,456

ABSTRACTS
Abstract and Index Collection in the Research Information Center of the National Institute of Standards and Technology.
PB94-152204 02,744

Annual Conference on Fire Research: Book of Abstracts, October 17-20, 1994.
PB95-104964 01,376

Publication and Presentation Abstracts, 1993. (Published by Paffenbarger Research Center and Center of Excellence for Materials Science Research).
PB95-153052 03,562

Abstract and Index Collection in the Research Information Center of the National Institute of Standards and Technology.
PB95-232633 02,741

Publications and Presentation Abstracts, 1995. (Published by Paffenbarger Research Center and Center of Excellence for Materials Science Research).
PB96-119250 03,568

Publication and Presentation Abstracts, 1995.
PB96-164082 03,576

Publication and Presentation Abstracts, 1994.
PB96-176623 03,577

Publication and Presentation Abstracts, 1996.
PB97-122238 03,585

ABUNDANCE
New IUPAC Guidelines for the Reporting of Stable Hydrogen, Carbon, and Oxygen Isotope-Ratio Data. Letter to the Editor.
PB95-261962 01,058

Accurate Measurements of the Local Deuterium Abundance from HST Spectra.
PB96-200621 00,110

AC STARK EFFECT
Configuration-Dependent AC Stark Shifts in Calcium.
PB96-157995 04,363

AC STARK SHIFT
RIS Measurements of the AC Stark Shift.
PB96-158035 04,078

AC STARK SHIFTS
RIS Measurement of AC Stark Shifts and Photoionization Cross Sections in Calcium.
PB96-157953 04,073

ACCELERATED LIFE TESTS
Macro- and Microreactions in Mechanical-Impact Tests of Aluminum Alloys.
PB95-107348 03,340

ACCELERATED TESTING
Assessing MOS Gate Oxide Reliability on Wafer Level with Ramped/Constant Voltage and Current Stress.
PB96-180112 04,115

ACCELERATING VOLTAGE
Modification of a Commercial SEM with a Computer Controlled Cathode Stabilized Power Supply.
PB96-201066 04,129

ACCELERATOR FACILITIES
Overview of a Radiation Accident at an Industrial Accelerator Facility.
PB97-122485 02,612

ACCELERATOR MASS SPECTROMETRY
Factorial Design Techniques Applied to Optimization of AMS Graphite Target Preparation.
PB95-151197 00,584

Comparative Study of Fe-C Bead and Graphite Target Performance with the National Ocean Sciences AMS (NOSAMS) Facility Recombinator Ion Source.
PB95-175790 00,693

ACCELERATOR MASS SPECTROSCOPY
36Cl/Cl Accelerator-Mass-Spectrometry Standards: Verification of Their Serial-Dilution-Solution Preparations by Radioactivity Measurements.
PB94-140563 00,524

ACCELEROMETERS
Testing the Sensitivity of Accelerometers Using Mechanical Shock Pulses Under NIST Special Publication 250 Test No. 24040S.
PB96-179544 02,683

ACCEPTANCE DIAGRAMS
Joy of Acceptance Diagrams.
PB94-200433 03,828

Transmission Properties of Short Curved Neutron Guides. Part 1. Acceptance Diagram Analysis and Calculations.
PB96-102199 04,021

ACCESS CONTROL
Computer Security Management and Planning in the U.S. Federal Government.
PB95-163432 01,596

Guidance to Federal Agencies on the Use of Trusted Systems.
PB95-163440 01,597

Functional Security Criteria for Distributed Systems.
PB96-123492 01,607

Distributed Communication Methods and Role-Based Access Control for Use in Health Care Applications.
PB96-183165 01,508

TMACH Experiment Phase 1. Preliminary Developmental Evaluation.
PB96-195318 01,618

ACCESS TO INFORMATION
Global Information Infrastructure: Agenda for Cooperation.
PB95-178604 01,482

ACCESSIBILITY
Electronic Access to Standards on the Information Highway.
PB96-131578 01,494

ACCIDENT INVESTIGATIONS
Ashland Tank Collapse Investigation.
PB95-126314 02,481

Ashland Tank-Collapse Investigation: Closure by Authors.
PB95-126322 02,482

Radiation Accident at an Industrial Accelerator Facility.
PB95-140117 02,575

Overview of a Radiation Accident at an Industrial Accelerator Facility.
PB97-122485 02,612

ACCOUNTING
Manager's Guide for Monitoring Data Integrity in Financial Systems.
PB96-165915 00,003

ACCREDITATION
NVLAP Procedures U.S. Code of Federal Regulations. Title 15, Subtitle A, Chapter 2, Part 7. (Effective December 1984; Amended September 1990).
PB94-160850 02,627

Program Handbook: Requirements for Obtaining NIST Approval/Recognition of a Laboratory Accreditation Body Under P.L. 101-592. The Fastener Quality Act.
PB94-210143 02,859

Survey on the Implementation of ISO/IEC Guide 25 by National Laboratory Accreditation Programs.
PB94-210150 00,479

National Voluntary Laboratory Accreditation Program: Energy Efficient Lighting Products.
PB94-219060 02,642

Should NIST Accredit U.S. Calibration Laboratories.
PB95-107280 02,646

National Voluntary Laboratory Accreditation Program (NVLAP): Commercial Products Testing.
PB95-267944 02,671

Laboratory Accreditation for Testing Energy Efficient Lighting.
PB96-122932 00,270

Proceedings of the Open Forum on Laboratory Accreditation at the National Institute of Standards and Technology, October 13, 1995.
PB96-210141 02,686

State Weights and Measures Laboratories: Program Handbook.
PB96-214705 02,687

ACCURACY
Numeric Data Distribution: The Vital Role of Data Exchange in Today's World.
N95-15937/2 02,622

Utc Dissemination to the Real-Time User.
N19960042622 01,521

Detector-Based Candela Scale and Related Photometric Calibration Procedures at NIST.
PB95-161949 04,273

Estimation of Measurement Uncertainty of Small Circular Features Measured by CMMs.
PB95-267928 02,918

Error-Bounding in Level-Index Computer Arithmetic.
PB96-109582 01,742

Progress Toward Accurate Metrology Using Atomic Force Microscopy.
PB96-146774 02,417

New Concepts of Precision Dimensional Measurement for Modern Manufacturing.
PB96-160684 02,924

NIST Frequency Measurement Service.
PB96-200662 01,561

ACETALDEHYDE
Fundamental Torsion Band in Acetaldehyde.
PB94-212834 00,840

ACETALS
Ring-Opening Dental Resin Systems Based on Cyclic Acetals.
PB95-162251 00,162

ACETONE CATIONS
Kinetics and Mechanism of the Collision-Activated Dissociation of the Acetone Cation.
PB94-216462 00,859

ACETONITRILE
Methyl Torsional Levels of Solid Acetonitrile (CH3CN): A Neutron Scattering Study.
PB95-151015 00,926

ACETYLENE
Spectroscopic Constants for the 2.5 and 3.0 micrometer Bands of Acetylene.
PB94-213071 00,847

Self-, N2- and Ar-Broadening and Line Mixing in HCN and C2H2.
PB95-108445 00,876

Decoupling in the Line Mixing of Acetylene Infrared Q Branches.
PB95-108452 00,877

Laboratory Studies of Low-Temperature Reactions of C2H with C2H2 and Implications for Atmospheric Models of Titan.
PB95-108726 00,690

Novel Polydiacetylenes Derived from Liquid Crystalline Monomers.
PB95-140125 01,235

ACETYLENE COMPLEXES
Rotational Spectrum and Structure of a Weakly Bound Complex of Ketene and Acetylene.
PB95-126140 00,896

ACETYLENE RADICALS
Kinetics of the Reaction C2H + O2 from 193 to 350 K Using Laser Flash Kinetic Infrared Absorption Spectroscopy.
PB95-203055 01,043

ACETYLENES
Vibrational Spectra of Molecular Ions Isolated in Solid Neon: HCCH+ and HCC-. (Reannouncement with New Availability Information).
AD-A253 551/6 00,707

ACID-BASE EQUILIBRIUM
